The WebObjects 5 Java Converter does not provide any warnings or errors when converting these validation methods. When converting a WebObjects 4.5 Java application to WebObjects 5 Java code, the converter does not properly change the WebObjects 4.5 void return method to a method returning the proper datatype. Since the method has no return value, EOF validation mechanism returns NULL and this leads to unwanted results at runtime.

Therefore, you should do a manual conversion based on the examples shown above in order for the EOValidation mechanism to function properly.

WebObjects: "EOEditingContext: Access With No Lock" in a DirectAction Method Errors

Using an EOEditingContext in a direct action method to fetch objects results in errors.
This article has been archived and is no longer updated by Apple.

Symptom:

Using an EOEditingContext in a direct action method to fetch objects results in the following errors:

*** EOEditingContext: access with no lock: recordForGID()!
*** EOEditingContext: access with no lock: recordObject()!

Firing faults also causes the EOEditingContext to complain:

*** EOEditingContext: access with no lock: globalIDForObject()!

Solution

Call lock() and unlock() on the EC inside the direct action method, as in:

```
 public WOActionResults testAction() {
ec.lock(); // Assume EC exists
.
// do fetch/processing with EC.
.
ec.unlock();
    }
```

WebObjects: LDAPAdaptor Stops Responding When Trying to Use Channel to Refetch

This article describes a WebObjects issue where LDAPAdaptor stops responding when trying to refetch, and provides a workaround.

This article has been archived and is no longer updated by Apple.

Symptom:

LDAPAdaptor stops responding when trying to use channel to refetch a second time.

Solution

The LDAPAdaptor in WO 4.5 never disconnects from the directory server after fetching. However, most directory servers will sever the connection after 30 minutes. The adaptor thinks that the channel is still valid when you try to connect after the server has severed the connection and the application will stop responding.

To correct this issue, explicitly close the LDAP channel once you are done with fetching.

In Objective-C

```
EOEditingContext *ec; // Assume this exists

EODatabaseContext *dbContext = [ec databaseContextForModelNamed:@"yourModel"];

EOAdaptorContext *adaptorContext = [dbContext adaptorContext];

// Close the channel

[[adaptorContext channels] lastObject] closeChannel];
```

In Java

```
EOEditingContext ec; // Assume this exists

EODatabaseContext dbContext = EOUtilities.databaseContextForModelNamed(ec,"yourModel");

EOAdaptorContext  adaptorContext = dbContext.adaptorContext();

// Close the channel

EOAdaptorChannel adaptorChannel = (EOAdaptorChannel)(adaptorContext.channels().lastObject());

adaptorChannel.closeChannel();
```

Macintosh: When System Restarts Instead of Shutting Down (2/95)

My Macintosh restarts when I select Shutdown from the Special menu. Why is this and how can I be assured my computer will actually shut down?

This article has been archived and is no longer updated by Apple.
The first step is to determine if the problem is software related. Restart your computer with the Disk Tools diskette and select Shutdown to see if it works properly. If it does, the likely cause of the problem is corrupted system software. A clean installation of system software is recommended to resolve the problem.

If choosing Shutdown still causes a Restart, try zapping PRAM. For more information on zapping the PRAM, for the Tech Info Library article "Macintosh: How to Reset Parameter RAM".

For Macintosh computers with lockable power switches, such as the Macintosh IIci and Macintosh IIsi, make sure the switch is not locked in the ON position. Rotating the switch 90 degrees to the left should release it so it is not in the locked on position.

If you determine the problem is not related to the power switch or system software, there are three possibilities: a defective keyboard, power supply, or logic board (in that order). As a quick test, disconnect the keyboard and mouse from the Macintosh and try a manual shutdown. If the Macintosh stays off, start replacing ADB devices. If not, have the power supply checked.

If the Macintosh still does not work properly, have the logic board replaced.

WebObjects 5.0: WORedirect "attempt to load the application failed" Errors

This document discusses errors that may occur when using the WORedirect class in a WebObjects 5 application, and provides a workaround.
This article has been archived and is no longer updated by Apple.

Symptom

When using the WORedirect class in WebObjects 5 applications, "attempt to load the application failed" errors occur and the following messages appear:

```
java.lang.NoClassDefFoundError: com/webobjects/appserver/WORedirect
at java.lang.Class.forName0(Native Method)
at java.lang.Class.forName(Class.java:120)
```

Solution

The WORedirect class (com.webobjects.appserver.WORedirect) has been misplaced in the JavaWOExtensions jar file. Add the JavaWOExtensions framework to the project and recompile.

The path to the framework is:

Mac OS X

```
/System/Library/Frameworks/JavaWOExtensions.framework
```

Windows

```
$NEXT_ROOT/Library/Frameworks/JavaWOExtensions.framework
```

This issue is expected to be addressed in a future version of WebObjects.

Published Date: Feb 18, 2012

WebObjects 5: Does Not Install on Mac OS X 10.0 Unless Logged in as root User

You must log in as the root user to install WebObjects 5 on Mac OS X.
This article has been archived and is no longer updated by Apple.

Symptom

WebObjects 5 will not install on your Mac OS X disk.

Solution

Log in as the root user to install WebObjects 5.

Important: The root user must be enabled before you can log in this way. The root user is enabled by default in Mac OS X Server but not in Mac OS X (client). Mac OS X 10.0 (client) is compatible with WebObjects 5 Developer but not WebObjects 5 Deployment. For more information, see:

Technical document 106290:
"**Mac OS X 10.0: About the root User and How to Enable It**"

Technical document 106361:
"**Mac OS X 10.0, Mac OS X Server 10.0: Password Does Not Work as Expected After a Change**"

Technical document 72598:
"**WebObjects Compatibility Guide**"

When root is enabled, you may follow these steps:

1. Choose Log Out from the Apple Menu.
2. In the Name field type: root
3. Enter the root password and click Log In.
4. Install WebObjects 5.

After completing this process, you should log out and log back in as your user or Admin user.

WebObjects: JDBC Adaptors

This document describes the JDBC Adaptor and provides a link to a technical note on how to write a JDBC plugin.
This article has been archived and is no longer updated by Apple.
With WebObjects 5, all database access goes through the JDBC Adaptor. JDBC is widely supported by database vendors, but not every data source behaves exactly the same way. As a result, the adaptor uses a helper class, a subclass of JDBCPlugIn, to customize the JDBC adaptor for a particular database or driver.

The JDBC Adaptor for WebObjects 5 ships with built-in support for Oracle 8i and OpenBase. Other data sources may require additional support from custom plugins. This technical note, as well as an example, can be found on Apple's Developer Web site (http://developer.apple.com/technotes/tn/tn2027.html).

Business Basic III: Distinguishing between RETURN and ENTER keys

This article has been archived and is no longer updated by Apple.
Using an invokable module (which you'd have to write), it is possible to detect whether the key pressed is located on the keypad or the main keyboard, and thereby distinguish (if you wish) between the RETURN key and the ENTER key. The Standard Device Drivers manual provides information on how this is done, particularly in Appendix G and in the chapter on the Console driver.

Also, Volume #1, Issue #1 of a magazine named "On Three" contains a program for recognizing the difference between the ENTER and RETURN keys. You can obtain a copy by writing to:

Attn: Order Dept.
P.O. Box 3825

AppleWorks 6 for Windows: Font Menu Does Not Scroll in Windows 95

This article describes an issue with font selection when using AppleWorks 6 for Windows under Windows 95, and provides a workaround.
This article has been archived and is no longer updated by Apple.

Symptom

When selecting fonts from the AppleWorks toolbar, the Font menu or ruler only displays a subset of available fonts. Fonts listed below the bottom of the screen cannot be selected as the Font menu will not scroll using the mouse.

Products Affected

- AppleWorks 6
- Windows 95

Solution

- Select the Text menu with the mouse, or by pressing Alt+T on the keyboard.
- Use the cursor keys on the keyboard to navigate through the Font submenu.
- Observe the status area of the AppleWorks window when navigating below the last displayed font in the listing.

Note: The selected font will continue to change in the status area (lower left corner) of the AppleWorks window, even when navigating to a font which is located beyond the displayed listing.

This issue does not affect AppleWorks 6 running under later versions of Windows.

iMac (Flat Panel): Use Latest Version of iPod Software

This document describes an issue with earlier versions of the iPod software and the iMac (Flat Panel) computer, and provides a workaround. This article has been archived and is no longer updated by Apple.

Symptom

- iPod may not appear on the desktop.
- A number of alert boxes may appear while copying information to and from iPod.
- iPod or the computer may stop responding.

Solution

iPod Software 1.0.4 (and later) includes enhancements for iMac (Flat Panel) computers. If you are using iPod software previous to 1.0.4, you should upgrade to the latest iPod software.

Verify that your iPod is up to date by downloading and running the latest iPod Software Updater available from the Apple Software Downloads Web site (http://www.apple.com/swupdates/).

For more information on how to find out which software version is installed on your iPod, see technical document 60984: "**iPod: How to Find Software Version**."

Mac OS X Server 10.1.5 for Xserve: RAID Creation and Deletion Does Not Work in Japanese

Using Disk Utility to create or delete RAID sets does not function properly when Japanese is the selected language.
This article has been archived and is no longer updated by Apple.

Symptom

RAID sets created in Disk Utility when Japanese is the preferred language do not appear in the Mac OS X Server installer. Existing RAID sets cannot be deleted in Disk Utility while Japanese is the preferred language. An alert box may appear with a message indicating that an unexpected error occurred.

Note: This issue only occurs when the Xserve is started up from the Mac OS X Server 10.1.5 CD.

Solution

1. Quit Disk Utility.
2. Click the Back button in the installer until you see the language selection screen.
Note: You may have to restart the Xserve if you have proceeded too far in the installer.
3. Select a language other than Japanese.
4. Choose Open Disk Utility from the Installer menu.
5. Create RAID set(s).
6. Quit Disk Utility.
7. Select Japanese.
8. Proceed with installation of Mac OS X Server 10.1.5.

iPhoto 1.1.1: Slide Show May Cause Computer to Stop Responding

Some computers may stop responding when using the Slide Show feature of iPhoto 1.1.1.
This article has been archived and is no longer updated by Apple.

Symptom

When watching a slide show in iPhoto, the slide show stops and the computer stops responding ("freezes").

Solution

If the computer stops responding during the slide show:

1. Press the Command-Option-Esc keyboard shortcut to open the Force Quit window.
2. Select iPhoto from the list of applications.
3. Click Force Quit.
4. Click Force Quit again to confirm. iPhoto quits.

If the computer does not respond to the Force Quit command, press and hold the power button on the computer to shut it down.

To resolve this issue, update to Mac OS X 10.2.3.
Published Date: Feb 18, 2012

Xserve: Server Does Not Fully Slide Into the Case

This document explains why Xserve may not fully slide into the case, and provides a workaround.
This article has been archived and is no longer updated by Apple.

Symptom

When sliding Xserve back into its case the server's chassis stops about 10 cm short with an audible metal against metal sound.

Solution

The locking mechanism has been moved to the locked position while Xserve was outside of its case (top cover).

To insert the Xserve fully into the case:

1. Turn the locking mechanism back to the unlocked position using the supplied hex key.
2. Slide Xserve into the case.

iPod (touch wheel): How to Reinsert the FireWire Port Cover

This document describes the FireWire port cover on the iPod with touch wheel, and explains how to reinstall it if it is accidentally removed.
This article has been archived and is no longer updated by Apple.
The iPod with touch wheel models come with a FireWire port cover attached to the case. (See Figure 1.)

Figure 1 Location of FireWire port and cover

1. FireWire Port Cover
2. FireWire Port
3. Headphones
4. Hold Switch

The FireWire port cover fits in iPod's FireWire port when it is not in use. The FireWire port cover protects the port from debris and the environment.

Installing the FireWire Port Cover

The FireWire port cover comes attached to iPod. You should not remove the FireWire port cover.

If the FireWire port cover is forcibly removed, it may be possible to reinsert it.

To reinsert the FireWire port cover:

1. Correctly orient the FireWire port cover.

2. Press firmly down on the plug to reinsert into the case:

Figure 2 Inserting the FireWire port cover

If you cannot reinsert the FireWire port cover after performing these steps, it may need to be repaired. You can arrange for repair at the iPod Service Web site (http://depot.info.apple.com/ipod/).

Business BASIC III: Random Access File Problem

This article has been archived and is no longer updated by Apple.
In Business Basic, if you open TWO random access files and then try to access some of the records, you get a SOS CALL ERROR 22. This error occurs, for example, in line 511 of the following sample program:

Enter the record number 723 for A%, and anything for B%;
enter anything for A$ and B$ on the first entry;
enter the record number 723 for A%, and anything for B%;
the system crashes with a "SOS CALL ERROR 22".

```
10 OPEN#6,".PROFILE/FILE1",15
20 OPEN#7,".PROFILE/FILE2",15
25 CATALOG".PROFILE"
30 INPUT "Enter A% ";A%
40 INPUT "Enter B% ";B%
50 ON EOF#6 GOTO 500
60 READ#6,A%
70 R=0:IF TYP(6)<>4 THEN GOTO 510
80 READ#6;A$
90 IF R=0 THEN 520
95 INPUT "Enter A$ & B$";A$,B$
100 WRITE#7,B%;A$
110 WRITE#6,A%;B$
120 GOTO 25
500 PRINT"Nothing in the file":OFF EOF#6:GOTO 70
510 PRINT"Nothing in the record":R=1
511 CLOSE#6
512 OPEN#6,".PROFILE/FILE1",15
513 GOTO 90
520 END
```

If, however, you add the following lines, the program seems to continue to work normally:

```
5 ON ERR GOTO 1000
1000 PRINT"Error# "; ERR
1010 OFF ERR
1020 GOTO 512
```

Use this workaround to avoid any further problems.

X11: How to Start Up in Color

Can X11 be started up in color?
This article has been archived and is no longer updated by Apple.
Yes. This article describes a recommended method, as well as two others.

The recommended method

1. Create a file called ".X11" in the home directory of the user. Ensure that the ".X11" file is executable. The contents of the ".X11" file:

X -screen 0 -depth 8

2. Log on, selecting an X Window session at the login dialog.

Here are two other methods

1. Modify the /usr/bin/X11/X file and insert before the $* in the startup entry:

-screen 0 -depth 8

2. Start X11 at the command line in color with the command:

/usr/bin/X11/X -screen 0 -depth 8

DAL: DB2 SQL Command Digits Workaround

I want to use the DB2 SQL command digits (a NumToString function), but DAL does not support this command.
This article has been archived and is no longer updated by Apple.
The workaround is to build a set of dummy tables to use as a scratch space for doing the conversions. Then use the standard DAL select command to retrieve the result.

DAL: DECnet Connection to VAX Not Supported

Does DAL support a DECnet connection to a VAX?

This article has been archived and is no longer updated by Apple.

No. DAL supports only AppleTalk for VMS and asynchronous connections to a VAX and the matching Comm Toolbox tools for them.

Published Date: Feb 18, 2012

DAL: Error Message 10632

I am using Oracle 6.029.1, AppleTalk for VMS 3.0, VMS 5.3, and DAL 1.2. When I issue the command:

open oracle DBMS
open oracle db as user xxx pw xxx; go

I get an error message "10632".
This article has been archived and is no longer updated by Apple.
This is a generic error message that may be caused by a number of different problems, including:

- DAL logicals not defined.
- DAL subsystem not installed.
- DAL server not found on the VAX.
- AppleTalk for VMS problem.
- INIT conflict on the Macintosh.

Published Date: Feb 18, 2012

DAL: Version 1.3 and Later Supports VM/XA

Does DAL support VM/XA?

This article has been archived and is no longer updated by Apple.

DAL 1.3 (and later) supports VM/XA. DAL 1.2 (and earlier) does not support VM/XA. However, since under XA and ESA for VM IBM does not support the "attach to database" SQL/DS command, you must issue the "Open Database" DAL command with either a null database name or "@ SQL". Using one of these special database names will cause DAL to not attempt to do the "attach" command, but instead to connect to the default database.

DOS Tool Kit: Assembler

Here's an undocumented fact about the DOS Tool Kit: If you have assembled a relocatable file and are then trying to run it from a BASIC program, make sure that the BASIC program file name does not begin with the same characters as your relocatable file.
This article has been archived and is no longer updated by Apple.
An example of what to avoid:

Relocatable file = Relocate Example.OBJO
BASIC file = Relocate

If you make this error, the following BASIC program (named Relocate) will fail and display the error message "Undefined statement at 5".

```
10 ADDRS=0: REM PRE ALLOCATE VARIABLE TABLE
20 PRINT CHR$(4); "BLOAD RBOOT" CALL 520
30 ADRS=USR(0),"RELOCATE.OBJO"
40 CALL ADRS
```

Simply by changing the name of the relocatable file to Example.OBJO, and changing line 30 in the above program as follows, you can correct the problem.

```
30 ADRS=USR(0),"EXAMPLE.OBJO"
```

System 7: Compatible TokenTalk Drivers

Article Change History

09/15/92 - REVIEWED
* For current version information.

What TokenTalk drivers are compatible with System 7?

This article has been archived and is no longer updated by Apple.
The compatible drivers are TokenTalk 2.2 (or later) and A/ROSE 1.1.3 (or later).

Published Date: Feb 18, 2012

DAL and DCA Drivers: Use DAL "Custom" Installation

I am trying to use a DCA MacIrma card to make a connection to my DAL server on an IBM mainframe. I get the message "network adapter not loaded, network not found."
This article has been archived and is no longer updated by Apple.
The most common cause of this error message is using "Easy Install" to install DAL. You need to use the "Custom" install option when installing DAL to load the DCA drivers.

Be sure to add a ":1" at the end of your script in your host.cl1 file whether running in CUT or DFT mode. You need to do this for MacIrma DAL driver 1.1.0 (or later), the only version DCA is supporting.

Ethernet: AAUI Connector Pinouts

What are the AAUI connector pinouts for: Macintosh Quadra computers, Apple Ethernet NB Card, and LaserWriter IIg printers?

This article has been archived and is no longer updated by Apple.

The AAUI (Apple Attachment Unit Interface) connector is a 14-position, 0.050-inch-spaced ribbon contact connector.

The pinouts are:

Pin	Signal Name	Signal Description
1	FN Pwr	Power (+12V @ 2.1W or +5V @ 1.9W)
2	DI-A	Data In circuit A
3	DI-B	Data In circuit B
4	VCC	Voltage Common
5	CI-A	Control In circuit A
6	CI-B	Control In circuit B
7	+5V	+5 volts (from host)
8	+5V	Secondary +5 volts (from host)
9	DO-A	Data Out circuit A
10	DO-B	Data Out circuit B
11	VCC	Secondary Voltage Common
12	NC	Reserved
13	NC	Reserved
14	FN Pwr	Secondary +12V @ 2.1W or +5V @ 1.9W
Shell	Protective Gnd	Protective Ground

AAUI signals have the same description, function, and electrical requirements as the AUI signals of the same name, as detailed in IEEE Standard 802.3-1990 CSMA/CD, section 7.

Aristotle: Display and Management Programs Quit Differently

We have Macintosh LC computers with Apple IIe cards installed and Apple IIe software version 2.0 in our lab. When teachers log on to the Macintosh LC and start the Apple IIe over the network, they connect to the server through the Aristotle menu system. Everything works fine, except they can't quit the teacher management menu. We get a screen with /ram2/ at the top and three options at the bottom. Why doesn't it go back to the Aristotle log-on screen?

This article has been archived and is no longer updated by Apple.
The screen displaying the /ram2/ indicates the Aristotle menu management application successfully quit. The /ram2/ screen is a menu system from ProDOS 8 version 1.9. The three options at the bottom of the screen provide the method of navigation through the menu system.

The current ProDOS volume name is /ram2/. To change to a different volume (that is, probably the AppleShare file server volume), press the Tab key. This displays all applications and folders (subdirectories) on the volume. (The "/ram2/" volume shows no applications or folders.) The up and down arrow keys allow you to move to an application or folder. The Return key launches an application, or opens a folder. The ESCape key closes the current folder and moves into the next higher folder.

Previous versions of ProDOS 8 left the user with the "ENTER PREFIX (PRESS "RETURN" TO ACCEPT)" message with the current prefix as the default. After entering the prefix, you need to enter the name of the application. The menu system of ProDOS 8 version 1.9 provides a more useful interface.

The two Aristotle applications, Display and Management, behave differently when the user exits: the Display program returns the user to the launching application, but Management returns the user to the ProDOS quit location. This is true both for an Apple IIe computer and for a Macintosh LC with Apple IIe Card.

Here are two ways to run Aristotle:

- First, you can run the Management program immediately. To accomplish this, go to the server's Administration program. Select the teacher and set the startup application to Aristotle's Management program. This option returns the teacher to the ProDOS 8 v1.9 menu (the /ram2/ screen).

LOGOFF from the Apple IIe Workstation Card disk provides a graceful sign off from the server. When you use LOGOFF, the log-on list of servers is not in alphabetical order. Open Apple-Control-Reset (Command-Control-Reset) works as well. This is not so graceful, but causes no damage.

- The second variation uses the Management program to set up a "class" of teachers who can run the Management program from the Display program. For example, when teachers log on to the server, their startup program is Aristotle's Display. From within Display's menu, teachers can select Management. This option returns to the Aristotle Display program. You need to quit the Display program to log off the file server.

TA47275_Apple_IIe_Card_Software_v_Not_Tested_with_System__(TIL08874).pdf

Apple IIe Card Software v2.0: Not Tested with System 6.0.7

Is it essential to install system software version 6.0.8 (that is, 7.0 print drivers) with the Apple IIe Card software version 2.0?

This article has been archived and is no longer updated by Apple.
The Apple IIe software v2.0 was only tested using system software version 6.0.8. There is no known reason for the Apple IIe Card v2.0 software to fail using version 6.0.7. However, Apple cannot stand behind the use of version 6.0.7 due to the lack of testing.

Whatever configuration you decide on, the print driver versions must be the same on all systems. Otherwise, there will be driver conflicts when the printers are used.

AppleShare Print Server: Transition from System 6 to System 7

Article Change History

09/15/92 - REWRITTEN
* To explain better the existing situation with System 6.0.8, the desired situation, and to note that AppleShare 3.0 is available.

I would like to use the Macintosh IIci as an AppleShare Print Server. I'm running system software version 6.0.8 (equivalent to System 6.0.7 with the addition of System 7 print drivers). I run the Network Products Installer version 6.0.7 to install the AppleShare Print Server, and it doesn't recognize the 7.0 LaserWriter drivers. I must quit the Installer, remove the 7.0 print drivers, install the print server software, and reinstall 7.0 drivers. Is there an easier way to do this?

This article has been archived and is no longer updated by Apple.
Unfortunately, it doesn't get much easier. The following steps will minimize the confusion:

1) Format the hard drive (if it's not already formatted).

2) Install system software 6.0.8 (if not already installed).

3) Remove the print drivers from the System Folder (in System 6.0.8, they are actually the System 7 print drivers).

4) Install the AppleShare Print Server using Network Products Installer 6.0.7.

5) Drag over the LaserPrep version 7.0 file from the 6.0.8 disks.

There is no need to reinstall the print drivers on the Print Server. They aren't used. However, it is VERY important to put the LaserPrep file in the folder with the Print Server's System file.

Note that upgrading to AppleShare 3.0 will eliminate much of this confusion and the steps required to get the print server running successfully with System 7 drivers.

System 7: Making KiwiEnvelopes 3 Work with LaserWriter IISC

I purchased KiwiEnvelopes 3.1.3 to be compatible with System 7. The version 3.1.3 did not print properly to the LaserWriter IISC with the Personal LaserWriter SC driver (Apple provides this driver for LaserWriter IISC System 7 compatibility).

The Personal LaserWriter SC feeds envelopes from the side of the tray, and the LaserWriter IISC feeds them from the center. Print on envelopes was in the wrong location (shifted downward on the envelope).

How can I get proper printing on the LaserWriter IISC?
This article has been archived and is no longer updated by Apple.
There are two ways to modify KiwiEnvelopes 3.1.3 to remedy this:

* Throw Away "KiwiFile3".
This causes the software to re-evaluate the printer in use and reset preferences. The software is now compatible with the LaserWriter IISC. However, you lose all names and addresses stored by KiwiEnvelopes.

* Use ResEdit to Remove the "PRTP" Resource from "KiwiFile3".
Trashing this resource resets preferences, but retains names and addresses stored in the file.

Warning: The instructions in this article refer to using ResEdit. Apple Computer, Inc., is not liable for any damage done to your software through the use of ResEdit to alter software.

LaserWriter IINTX: DIP Switch Positions Affect Renaming

After moving a LaserWriter IINTX, we could find the printer in the Chooser as "LaserWriter IINTX," but the name should be "LaserWriter IINTX 5/80." On the start page, the name was "LaserWriter IINTX 5/80," but the Chooser again called it "LaserWriter IINTX." We renamed the printer, and the name appeared on the start page, but not in the Chooser. The LaserWriter IINTX printed normally through all this.

We found that the DIP switches 5 and 6 were down. We switched them up, and this fixed the naming problem. Can you explain this behavior?

This article has been archived and is no longer updated by Apple.
Moving switches 5 and 6 to the down position sets asynchronous handshaking to XON/XOFF. The LaserWriter broadcasts the default printer name set in ROM instead of using the changeable version set in the ZPRAM (Zero Power RAM). The startup page still registers the correct name, but the name broadcast over the network doesn't change.

Make sure that both switches are in the up position unless you require another form of handshaking. Other combinations of these switches do not cause the name inconsistencies.

Applesoft Tutorial: Errata

The following manual corrections are for the Applesoft Tutorial manual.
This article has been archived and is no longer updated by Apple.
Page 6
References to the RESET key need to refer to CTRL-RESET for newer Apples.

Page 17
"STOPPING THE COMPUTER"; Pressing RETURN after a CTRL-C may be required if the Apple is waiting for input from the keyboard.

Page 23-24
There are only five different elementary arithmetic operations. They are:
+ Addition
* Multiplication
- Subtraction
/ Division
^ Exponentiation

Page 37
GAMEPOINTS = 45 won't work because it contains the key word, INT. It will be parsed as GAMEPO INT S and it will return a SYNTAX ERROR. GAMEPTS = 45 should be OK.

Page 38
The line before the last listing should say "Try the statements below in order:" instead of "Try the statements on the next page in order:"

Page 59
Line 230 at the bottom of the page should read: 230 IF N < = 10 THEN GOTO 210

Page 63
Line 270 should read: 270 X = X / 7

Page 65
Line 3220 should read: 3020 COLOR = N

Page 69
The last line on the page reads:
120 PRINT "THE STRIKES AND BALLS ARE ";STRIKES;" ";BALLS
It is difficult to tell this because the space after STRIKES;" comes at the end of the line of listing.

Page 71
Lines 650 and 660 are reversed. They should read:
650 NEXT Y
660 NEXT X

Page 79
The two example line 780s are incorrect. The word "BACKGROUND" will be parsed as "BACK GR OUND" because GR is a key word and because there is already a variable BALL which would share the same Applesoft variable name, BA. Try using "FIELD" instead.

Page 81
Paragraph 3, "One possible solution is given on the next page," should read "One possible solution is given below,"

Page 85
Line 220 has an extra ")". It should read: 220 COLOR= INT (16 * RND(1))

Page 95
The program will give incorrect values for the Y variable unless a time delay is installed. Add this line: 1005 FOR J = 1 TO 10: NEXT J

Page 96
Line 360 should read: 360 FOR S = 0 TO 1: REM 2 LINES, FROM Y AND Y + 1

Page 105
Replace line 120 with: 120 WHOLE$ = HALF$ + " " + OTHERHALF$

Page 108

According to page 99 and iii, the title on this page should read "INTRODUCING ARRAYS: DIM".

Page 109
The last sentence in the last paragraph should read "The program below accomplishes this."

Page 109
Line 340 should read:
340 TEMP = GLASS(WINE):GLASS(WINE) = GLASS(MILK):GLASS(MILK) = TEMP

Page 110
Starting in the middle of the 9th line, the text should read; "Then line 320 makes sure that the value of WINE is not equal to the value of MILK at any given time. The contents of variables GLASS(WINE) and GLASS(MILK) are switched in line 340. Finally the array is printed with lines 370 through 390."

Page 130
Clear the entire screen should be press <ESC> then <SHIFT> and <P@> instead of <CTRL> and <P@>.

Page 148-149
The green keys should have slashed zeros to differentiate them from capital O.
Published Date: Feb 18, 2012

AppleWorks: Problems with calculations in spreadsheets

If, in cell A1, you enter the formula 17.9-17*10, the cell will display 9, the correct result. If you then enter, in cell A2, @INT(A1), the cell will display 8. Even if you try the @IF, the result will always be something less than 9.

This article has been archived and is no longer updated by Apple.

This phenomenon is not the application's fault: it's that old standard floating point error. Remember that 17.9-17 isn't .9, but rather .899999, so that when you multiply by 10, you get 8.99999--and @INT(8.9999) = 8. The best workaround is to use @INT(A1+0.5) instead.

AppleShare PC: Lists Servers in Response Order, Not Alphabetical

Why doesn't AppleShare PC list all of the servers in alphabetical order in the DA?

This article has been archived and is no longer updated by Apple.

AppleShare PC does a broadcast to get zone information, then lists the servers in the order in which they respond.

Published Date: Feb 18, 2012

System 7: Tips for Using Memory Efficiently

When it's difficult to open applications or print, these tips will help use Macintosh memory more efficiently. For more information about managing memory, see the Macintosh User's Guide.

To use System 7, your Macintosh needs at least 2MB of memory. If you customarily work with several programs at a time, you may wish to install more memory.

This article has been archived and is no longer updated by Apple.

Use the Available Memory

If you get a message asking if you'd like to open a program using the "available memory," click OK, and the program will open. This message appears when the available memory is greater than the minimum memory required to open the program, but less than the recommended amount. In rare cases, you may be unable to use some features of the program.

Quit Some Open Programs

When you open an application and see the "not enough memory" message, you should quit one or more open programs. Open the Application menu (right end of the menu bar) to see which programs are open.

This message appears when the available memory is less than the minimum required to open the program.

Reduce a Program's Memory Size

You can often avoid memory problems by reducing a program's current memory size. In rare cases, reducing a program's memory size degrades performance. Follow these steps to reduce a program's memory size:

1) Quit the program.

2) In the finder, select the program's icon.

3) Choose Get Info from the File menu. The program's Info window appears.

4) Reset the memory size.

5) Close the Info window.

6) Try again to open the program.

Quit Some Programs Before Printing

When you print, you'll sometimes see the Application menu begin to blink. When this happens, follow these steps to quit a program and make more memory available for printing:

1) Choose Finder from the Application menu. You'll see an alert box.

2) Click OK to close the alert box.

3) From the Application menu, choose the program you want to close. The program becomes active.

4) Choose Quit from the File menu.

After quitting one or more programs, try printing again.

Set the Disk Cache to the Smallest Size

The disk cache is a portion of the computer's memory set aside to limit how often the computer must read from a disk. This speeds up the computer's performance. By reducing the size of the disk cache, you can make more memory available for application programs. Follow these steps to adjust the disk cache:

1) Choose Control Panels from the Apple menu.

2) Open the Memory control panel (double-click the Memory icon).

3) In the Memory control panel, click the down arrow repeatedly until the disk cache is the smallest possible size.

4) Choose Restart from the Special menu to restart the Macintosh.

Drag Optional System Extensions Out of the System Folder

System extensions (also known as INITs) compete with application programs for memory. (System extension icons are often displayed in the bottom-left portion of the screen when the computer starts up.) You can conserve memory by removing system extensions that you don't need. For instance, if your Macintosh is not connected to a host database, you can remove the DAL (Data Access Language) system extension. Likewise, if your Macintosh is not connected to a network, you can remove the AppleShare system extension. Follow these steps to remove system extensions:

1) Open the System Folder.

2) Open the Extensions folder.

3) Drag the system extension icon out of the System Folder to another location on your hard disk.

4) Restart the computer.

Restart the Computer

If you have opened and closed a number of programs, your Macintosh memory can become fragmented so that you can't open a large program. When this happens, quit all the open programs, and restart the computer.

Turn Off Background Printing

When background printing is on, you can print while using the computer for other work. If you don't need background printing, you can reduce the amount of memory required to print by turning it off. Follow these steps to turn off background printing:

1) Choose the Chooser from the Apple menu.

2) In the Chooser window, select a LaserWriter icon.

3) Click the Background Printing: Off button.

Turn Off File Sharing

When file sharing is turned on, you can share information on your computer's hard disk with other users on a network. If you don't currently use file sharing, you can conserve memory by turning it off. Follow these steps to turn off file sharing:

1) Choose Control Panels from the Apple menu.

2) Open the Sharing Setup control panel (Double-click the Sharing Setup icon).

3) Click Stop in the File Sharing section of the Sharing Setup control panel. A message appears asking how many minutes the computer should wait until file sharing is turned off.

4) Type a number, and click OK.

AppleTerm: Using it with a IIc or IIe

If the AppleTerm program refuses to address a modem when a printer is attached to another port or card, check that the printer is turned on and selected. If so, everything should work right.
This article has been archived and is no longer updated by Apple.
If the printer isn't turned on or selected, and is yet still connected to the port or card, then the modem won't work. The program sends an initialization procedure to the printer, and if it doesn't get something back from the printer firmware, it will hang.

Usually what happens is that a "@" appears in the upper left corner of the screen.

NOTE: This same problem will occur if the printer interface isn't on an Apple Super Serial Card: AppleTerm will only acknowledge an Apple SSC.

TA47299_LaserWriter_IIf_and_IIg_How_They_Differ_from_LaserWriter_IINTX_(TIL08910).pdf

LaserWriter IIf and IIg: How They Differ from LaserWriter IINTX

This article describes the enhancements of the LaserWriter IIf and IIg, compared to the LaserWriter IINTX.

This article has been archived and is no longer updated by Apple.
The LaserWriter IIf offers a 50% performance improvement over the LaserWriter IINTX. With gray scale mode disabled, the LaserWriter IIg gives twice the performance of the IINTX. The IIg's performance is the same as the IINTX with gray scale mode active.

The LaserWriter IIf and IIg controllers provide twice the processing power of the LaserWriter IINTX. The major controller components include:
- Processors
- Memory
- ASICs (Application Specific Integrated Circuits)
- I/O

These components, plus the PostScript Level 2 software, provide significantly faster performance than LaserWriter IINTX.

The Motorola 68030 in the IIf and IIg improves performance over the 68020 in the LaserWriter IINTX in the following ways:

- The 68030 runs at a faster clock speed. This makes the IIf 25% faster and the IIg 55% faster than the IINTX.

LaserWriter	Clock Speed
IINTX	16 MHz
IIf	20 MHz
IIg	25 MHz

- The 68030 has integrated instruction and data cache to give a 15% performance improvement over the IINTX.

- The 68030 has burst-mode RAM access to transfer large amounts of data in less time.

PhotoGrade allows printing more than 65 levels of gray. The LaserWriter IINTX offers 33 levels of gray.

The IIf and IIg use 80ns memory. This means that RAM from the IINTX or IISC can't be used in the LaserWriter IIf or IIg. The Macintosh IIci uses the same RAM as the LaserWriter IIf and IIg.

Unlike the LaserWriter IINTX, the LaserWriter IIg has three communication ports, and all three can be physically connected at the same time. Arbitration logic controls the activity of the ports. Because PostScript processes one job at a time, only one port has access to the printer at any given time.

LaserWriter IIf and IIg: Support Issues

This article discusses some of the support issues for the LaserWriter IIf and IIg
This article has been archived and is no longer updated by Apple.

Driver and Level 2 Support

The driver shipped with LaserWriter IIf and IIg is the LaserWriter driver version 7.0, which doesn't support PostScript Level 2 operators. Access to new Level 2 features is limited to downloaded PostScript programs. The next LaserWriter driver will add Level 2 functionality. The IIf and IIg operate more efficiently even without the new driver because of improved memory management and high speed cache.

Missing Type 1 Fonts In ROM

Due to extremely limited ROM space, the ITC Zapf Dingbats Type 1 font was removed from LaserWriter IIf and IIg ROMs, and included, as a downloadable font, on the font disk.

Legal Size Printing

The standard LaserWriter IIf and IIg configurations don't support full legal size printing. At the standard RAM configurations, the LaserWriter IIf can't print full legal pages and the LaserWriter IIg can't print grayscale legal pages. If you want to use legal size paper with full printing capability, upgrade the RAM from 2MB to 4MB on a LaserWriter IIf, and from 5MB to 8MB on a LaserWriter IIg.

Don't Use Refilled Toner Cartridges

Refilled cartridges performed poorly during LaserWriter IIg gray-scale testing, and aren't recommended.

Kanji Support

The LaserWriter IIg has composite font support, but due to the HFS disk structure, there is no copy protection for the Kanji fonts. Kanji will be fully supported in the LaserWriter 1.1 ROMs.

No Diablo 630 Emulation

LaserWriter IIg ROMs don't provide Diablo 630 emulation.

Apple OneScanner: How it Differs from the Apple Scanner

This article describes the Apple OneScanner's enhancements, compared to the original Apple Scanner.

This article has been archived and is no longer updated by Apple.

Overview

The Apple OneScanner looks like the Apple Scanner flatbed scanner, but supports 8-bit gray scale and provides higher performance. The new scanning application -- called Ofoto -- produces high-quality scans. HyperScan 2.0 scans the images directly into HyperCard to resize the cards and give better image control.

Features

These features differ from the Apple Scanner:

- 8-bit image depth (256 gray scale resolution)

- Variable resolution from 72-dpi to 300-dpi in 1-dpi increments

- Higher scanning and data transfer speed

- Finer control of brightness and contrast settings

- No ADB port

Software Compatibility

All of the Apple OneScanner software is backward-compatible with the original Apple Scanner. A software upgrade kit will give the Apple Scanner all the features of the new software. The Apple Scanner is limited to 4-bit gray scale, but the software upgrade produces better images and is much easier to use.

Published Date: Feb 18, 2012

Apple OneScanner: Support Issues

This article outlines tips for using the Apple OneScanner.
This article has been archived and is no longer updated by Apple.

Software

The Ofoto software requires LaserWriter drivers 6.0.1 or later. Gray scale images won't print properly with earlier drivers.

Ofoto also requires system software version 6.0.7 or later and 32-bit QuickDraw. It is fully compatible with System 7.

Lamp

You need to change the lamp after approximately 30,000 scans. The scanning software indicates when it's necessary to change the scanner lamp.

Macintosh Quadra and Power Macintosh

These computers use a faster SCSI chip, with reset interrupt timing 10 times shorter than previous Macintosh computers. Because of this timing difference, they develop SCSI gridlock and the scanning software indicates that the scanner isn't connected. This occurs only when the scanner is turned on before the Macintosh is turned on.

The solution is to reset the timing by turning the scanner off, then on again. When Ofoto doesn't recognize the scanner, it displays a note in the dialog box telling the user to cycle the scanner power and try again.

Note: With other SCSI devices you normally would want to turn the device on before the Macintosh starts so it will be recognized at startup. With older devices connected to a Macintosh Quadra or Power Macintosh, you may have to cycle power on the SCSI device after the Macintosh completes its boot process.

TA47303_Apple_Access_II_Character_Delay_and_Line_Delay_(TIL00892).pdf

Apple Access II: ‘Character Delay‘ and ‘Line Delay‘

This article has been archived and is no longer updated by Apple. Access II version 1.1 has fixed the problem of 'Line Delay' working erratically. In versions previous to 1.1, a line delay of 100 resulted in a considerable delay, but changing the line delay to 9999 resulted in less delay.

Published Date: Feb 18, 2012

StyleWriter: Printing from Apple IIe Card

Does the Apple IIe Card software version 2.0 support printing to the StyleWriter?

This article has been archived and is no longer updated by Apple.
The Apple IIe Card version 2.0 allows printing via print drivers installed in the Macintosh LC computer System Folder. If the StyleWriter driver (or other driver) is in the Macintosh LC System Folder, the Apple IIe Card can print to the StyleWriter (or other printer).

Follow these steps:

1) In the Apple IIe Option Panel, place the Printer Card icon in the appropriate slot using the Slots icon in the scrolling icon area. By convention, this is slot 1.

2) In the scroll icon area, choose the Print Card icon. This displays the currently selected printer.

3) A note in the dialog area indicates that you can select alternate printers via the Chooser desk accessory. Select a printer in the standard Macintosh Chooser.

Graphic Conversions Between Macintosh and Windows

What are some methods for exchanging graphic files between a PC and a Macintosh? Does the PICT file format translate easily?
This article has been archived and is no longer updated by Apple.
Typically, if you have a similar program on both platforms, such as Adobe PhotoShop, the files are readable across platforms. The PICT file format is not easily read on a Windows computer and is not recommended.

If you have existing graphics on either platform, here are a couple of suggestions for exchanging them between the PC and Macintosh.

- Use MacLinkPlus from DataViz. More information is available from their Web site at http://www.dataviz.com/.
- Save the document in the GIF or JPEG file format. There are graphics viewers available for both Macintosh and Windows that allow you to view the document.

10Base-T Ethernet Network: Source of Wiring Specification

I want to install a 10Base-T Ethernet network. What are the specifications (type of cable, number of conductors, wiring scheme, RJ-45 information, and so on) that we need to know to wire a 10Base-T network with a backbone?
This article has been archived and is no longer updated by Apple.
You can search the Institute of Electrical and Electronics Engineers (IEEE) Web site for specific information on the 10Base-T specification, encompassed in the IEEE 802.3 spec.

Alternatively, you can refer to the vendor of your Ethernet hardware for specifications relevant to the hardware you are installing. If you have not yet purchased equipment, use your favorite Internet search engine to search the web. "Ethernet wiring" would be a good search query to start with.

Institute of Electrical and Electronics Engineers (IEEE) Web site: **http://www.ieee.org/**

ImageWriter II: Every Other Line Faded

This article has been archived and is no longer updated by Apple.

When an ImageWriter II prints correctly in one direction (either left to right, or right to left), but prints faded lines in the opposite direction, try replacing the ribbon wire and spring (935-0001). If the spring has been stretched slightly, the wire can slip on the pulley when moving in one direction. This prevents the ribbon from advancing and creates the faded lines.

AppleShare Server 3.0: Upgrade Information (Discontinued)

The following information serves to inform customers how to upgrade to AppleShare Server 3.0.
This article has been archived and is no longer updated by Apple.
AppleShare Server 3.0 was introduced on October 15, 1991. As a method of upgrading the installed base as well as new customers to AppleShare Server 3.0, an upgrade program - via a coupon - has been established. New customers will be eligible to receive AppleShare Server 3.0 at no charge, the installed base will be offered a reduction in price to upgrade.

The disk file - AppleShare Coupon - is the upgrade coupon for new customers. The order form - AppleShare Order Form - is for the installed base. Although the AppleShare Server 3.0 product will not be available for fulfillment until December, the program begins on October 15, 1991; therefore, coupons may be submitted to the fulfillment house to begin processing on October 15. In addition, coupons (both the new customer coupon and the installed base order form) are available through PROMO.DIST. When requesting additional coupons through PROMO.DIST please note the number as follows:

* #900300 - coupon for new customers to receive the product at no charge.

* #900301 - order form for the installed base to purchase the product at a reduced price.

Requirements

Customers who purchase AppleShare File Server 2.0 between October 15, 1991 and December 31, 1991 will be eligible to receive AppleShare Server 3.0 at no charge.

* The customer is required to mail (to the address indicated on the coupon):
1) The AppleShare coupon (obtained from an authorized Apple Reseller);
2) An original, dated, itemized sales invoice as proof of purchase; and
3) Their original AppleShare File Server 2.0 - Server Installer disk (for each upgrade requested)

* This offer is available for fulfillment through April 1, 1992.

Customers who purchased AppleShare File Server 2.0 prior to October 15, 1991 will be offered a reduction in price to upgrade to AppleShare Server 3.0.

* The customer is required to mail (to the address indicated on the coupon):
1) The AppleShare order form (obtained from an authorized Apple Reseller).
2) Their original AppleShare File Server 2.0 - Server Installer disk (for each upgrade requested), include AppleShare 2.0 Print Server - Server Installer disk if applicable.
3) A certified check or money order for the amount as follows: AppleShare 2.0 File Server owners (only)$299 AppleShare 2.0 File and Print Server owners $199

* This offer is available for fulfillment through April 1, 1992.

Customers who own ONLY AppleShare 2.0 Print Server are required to purchase the AppleShare Server 3.0 product from an authorized Apple reseller.

System 7: PrintMonitor Problem when Quitting Foreground App

Article Change History

09/22/92 - UPDATED
* To add information about System 7 Tune-Up.

Why does PrintMonitor sometimes crash when I quit the application that produced the print job?

This article has been archived and is no longer updated by Apple.
This is a known problem in the 7.0 Process Manager, which fails to keep the driver open when it shuts down the foreground application. You can avoid this problem by not quitting out of the foreground application (the one from which you requested the print) while PrintMonitor is in the process of printing.

But this problem has been solved with the LaserWriter driver version 7.1.1 (or later), found on the System 7 Tune-Up disk. To avoid the problem in the future, upgrade to this version of the LaserWriter. If you suspect your copy of PrintMonitor has already been damaged, replace it as well.

AppleTalk Remote Access: Activity Log

What is the Activity Log?

This article has been archived and is no longer updated by Apple.

This is the component of AppleTalk Remote Access that maintains a log of incoming and outgoing calls and connections. The data wraps after 1000 entries. For auditing and tracking, you can cut and paste the data into spreadsheets or databases.

Published Date: Feb 18, 2012

Scribe Printer: What Kinds of Paper to Use (10/93)

What kind of paper can I use in the Scribe printer?

This article has been archived and is no longer updated by Apple.
Tests of continuous feed papers for the Scribe Printer have shown that most smooth finish papers are acceptable, whether fanfold or single-sheet.

If you wish to use other papers, keep in mind that although no specially-coated paper is necessary, it's nevertheless true that the smoother the paper, the better the print quality. Even standard pin-feed and copying machine papers (such as Xerox 4024 copy paper) yield satisfactory results; avoid using rougher-textured papers, though, such as personal stationery or papers with a high rag content.

AppleTalk Remote Access: the Application

What is the function of the Application component of AppleTalk Remote Access?
This article has been archived and is no longer updated by Apple.
This is the main application that performs these functions:

- Sets up the connection documents
- Views the status and activity log
- Initiates or terminates a remote connection
- Enables call answering (answers calls whether or not the application is open.)

Published Date: Feb 18, 2012

AppleTalk Remote Access: Connection Document

What is the Connection Document?

This article has been archived and is no longer updated by Apple.

A blank connection document appears when you double-click the Remote Access application. AppleTalk Remote Access uses the document when initiating a connection. The connection document specifies the caller's name, password, and phone number of the server Macintosh.

You can save all the configuration information to use later. You can choose whether to save the password with the connection document.

You can also set the time interval between active-connection reminders. This is helpful if you're concerned about phone charges. The default is no reminder.

Published Date: Feb 18, 2012

AppleTalk Remote Access: Modem CCL Files

Where do the modem CCL files go during AppleTalk Remote Access installation?
This article has been archived and is no longer updated by Apple.
The installation process places the modem Connection Control Language (CCL) scripts in the Extensions folder. The scripts appear in the pop-up menu in the Remote Access Setup control panel.

Advanced users can look at the CCL scripts by changing the file type from "mlts" to "TEXT" and reading it with any application that reads text files. A HyperCard stack is available to assist in the development of CCL files. This Modem Workshop tool allows you to interactively edit, run, and monitor CCL scripts.

Installation also places the AppleTalk Remote Access and MNPLink Tool extensions in the Extensions folder. These extensions create and maintain a reliable connection.
Published Date: Feb 18, 2012

AppleTalk Remote Access: Network adev (Remote Only)

What is the AppleTalk Remote Access Remote Only adev?
This article has been archived and is no longer updated by Apple.
The Remote Only adev (AppleTalk device) is installed in the Extensions folder and appears in the Network CDev. You can disconnect from the local network and see only the remote network. Here are two situations where you might need to do this:

- In the Event of a Network Number Conflict

When a resource on the remote network has the same number as a resource on the local network, you can access the remote resource using the Remote Only adev.

- When You Have a Printer Port, and No Other Network Connections

When you must use the printer port for something other than AppleTalk, you can use the Remote Only adev to free up the printer port. For example, a non-networked Macintosh with a serial printer connected to the printer port and a modem connected to the modem port.
Published Date: Feb 18, 2012

AppleTalk Remote Access: Security

AppleTalk Remote Access implements security in several ways, at the Macintosh level and at the network level.
This article has been archived and is no longer updated by Apple.
This document, including graphics, is also available from Software Updates as a self extracting archive of a MacWrite II document. Download, expand, and open with MacWrite II or compatible word processors. It discusses the general security features available with AppleTalk Remote Access. In addition, it specifically addresses the network-wide control functionality which is available for the more security conscious.

This document discusses the general security features available with AppleTalk Remote Access. In addition, it will specifically address the network-wide control functionality which is available for the more security conscious.

Security Features
AppleTalk Remote Access offers sophisticated security options that allow you to restrict access to your computer and any network to which it is connected. They include user-controlled options such as:

- User name and password authentication
- A callback feature which verifies the user's identity by returning their call to a predetermined phone number
- An activity log for recording calling and answering activities, and ´ A hacker proof feature which disables a user account after seven incorrect password attempts

In addition, AppleTalk Remote Access has a built-in network-wide security option. This enables a network administrator to maintain control over who can set up a Remote Access Server on the network.

In order to activate this feature, the network administrator will need to create a special SecurityZone password on the network via some AppleTalk router. (Setting up this SecurityZone is explained later in this document)

The network password is encrypted with DES and is placed in the later half of the SecurityZone name.

Once this SecurityZone is established, AppleTalk Remote Access will request a password anytime an attempt is made to check the 'Answer calls' box. (see below)

If an incorrect password is entered, answering will be disallowed. At this point, users will not be able to use this Macintosh for dial-in access to the network.

NOTE: You can allow exclusive access to a Macintosh on a secure network (for example, if you wanted to share files via File Sharing). This can be accomplished by either physically disconnecting the answering Macintosh from the network or through selecting 'Remote Only' in the network control panel.

IMPORTANT: A fail-safe feature is part of the SecurityZone implementation. There are two scenarios where this is initiated. 1) If the user is not connected to the network when they set up answering and then reconnects and 2) If a SecurityZone is established after 'Answer calls' is checked. AppleTalk Remote Access always does a SecurityZone query when a user tries to dial into the system. In either of the above cases, answering would have been disabled and the call would be terminated.

SecurityZone Set Up
A special HyperCard stack must be used to initially generate the a SecurityZone name with your DES encrypted password.

Once you generate the above zone name, you will need to get access to an AppleTalk router (any AppleTalk Router will work) and create a zone name which exactly matches the name generated by the above stack. Once you create the zone name, it will be distributed throughout the internet via RTMP. The AppleTalk Remote Access software will now require a password anytime someone.
Published Date: Feb 18, 2012

AppleTalk Remote Access: Setup

What is Remote Access Setup?
This article has been archived and is no longer updated by Apple.
This is a control panel device (CDev) that is normally the first component used after installation. It is used to do the following:

- Select the modem type and modem port.
- Allow incoming calls.
- Set the duration of a connection.
- Enable access to the attached network.
- Control the modem speaker.

Published Date: Feb 18, 2012

AppleTalk Remote Access: Status Window

What is the Status Window?
This article has been archived and is no longer updated by Apple.
This window shows the current status of AppleTalk Remote Access. It uses the following messages:

- "Idle..." when no connections are present or being attempted
- "Waiting to answer incoming call..." when ready to accept calls
- "Waiting for call back..." or "Dialing..." to show the stage of making connection or answering a call

Published Date: Feb 18, 2012

AppleTalk Remote Access: Users and Groups File

What is the function of the Users and Groups File component of AppleTalk Remote Access?

This article has been archived and is no longer updated by Apple.

AppleTalk Remote Access uses System 7 file sharing to control access. It uses the same user name and password entered in the file sharing Users and Groups file. You enter the call back phone number here. If installed on an AppleShare 3.0 file server, the file server's Users and Groups file controls access. You access the Users and Groups file via the administrator's program. The menu item doesn't work in this case.

Published Date: Feb 18, 2012

TA47323_AppleShare_Installing_and_Upgrading_Servers_(TIL08948).pdf

AppleShare 3.0: Installing and Upgrading Servers

This article tells you what you need to install or upgrade servers to AppleShare 3.0.
This article has been archived and is no longer updated by Apple.
To upgrade to AppleShare 3.0, you must first upgrade the system software to version 7.0 or later.

The AppleShare 3.0 installation process converts an AppleShare 2.0.1 Users and Groups file for 3.0 use. If System 7 file sharing was activated, the Users and Groups file is active, and the file will be used for the AppleShare 3.0 file. If both files are present, a dialog box prompts the administrator to choose which file to use.
Published Date: Feb 18, 2012

AppleShare 3.0: Using 2.0.x Workstation Software

This article explains the limitations of using AppleShare 2.0.x workstation software with AppleShare 3.0 server software.

This article has been archived and is no longer updated by Apple.

AppleShare 2.0.x clients and System 7 clients can access AppleShare 3.0 servers, but can't use the new features of AppleShare 3.0. If a user with an expired password logs on to an AppleShare 3.0 server, that user's old workstation software doesn't support the extended security, and he or she won't be able to log on. The new workstation software gives a message and the opportunity to enter a new password.

Published Date: Feb 18, 2012

AppleShare 3.0: Access Information Dialog Box

This article describes the functions of the Access Information dialog box.
This article has been archived and is no longer updated by Apple.
The administrator can perform the following functions in the Access Information dialog box.

- Share folders and volumes.

- Lock a file: This is similar to locking a file in the Finder's Get Info window.

- Copy-protect a file: This prevents making Finder copies of a file, but certain utilities can still copy the file.

- Limit launches: This limits the number of times users can simultaneously launch an application.
Published Date: Feb 18, 2012

AppleShare 3.0: Maximum Number of Connected Users

What is the maximum number of connected users allowed by AppleShare 3.0?

This article has been archived and is no longer updated by Apple.

Version 3.0 of AppleShare increased the maximum number of connected users from 50 to 120. The default setting is 50. The practical upper limit for connected users is probably less than 120 for reasonable response time. Also, the Hierarchical File System (HFS) limits the number of open files to 346.

Published Date: Feb 18, 2012

AppleShare 3.0: User Setup Dialog Box

A change in the User Setup dialog box gives the administrator more control over user passwords.

This article has been archived and is no longer updated by Apple.

The administrator can force users to change passwords the next time they log on. This is useful when creating several users and giving simple default passwords, such as initials.

Published Date: Feb 18, 2012

AppleTalk Remote Access: Requirements and Components

This article describes the connection and client/server characteristics, requirements, and components of the AppleTalk Remote Access software.
This article has been archived and is no longer updated by Apple.

The Connection and Client/Server Characteristics

AppleTalk Remote Access provides an asynchronous AppleTalk connection through a modem to another Macintosh and its AppleTalk network. The remote user can access all the AppleTalk services such as mail, calendars, file servers, and printers. The software is meant for personal use, and it is easy to set up and configure. It supports one connection at a time.

This software can act as client or server. AppleTalk Remote Access behaves as a node on its local network as well as the remote network, and has access to all services on both networks. As a client on the remote network, it doesn't allow the rest of the remote network to gain access to its local network. In other words, it doesn't create two-way access between networks.

Requirements

For optimum performance, Apple recommends using a V.32 capable 9600 bps or faster modem. A 2400 bps modem provides satisfactory access to on-line mail services or calendaring systems. Connection speeds slower than 2400 bps are likely to cause AppleTalk to time-out between packets. The software supports connection speeds of 2400, 9600, and 19200 bps. It requires System 7 or later, but runs on any CPU capable of running System 7. AppleTalk Remote Access supports built-in serial ports, not serial cards.

Components

- Remote Access Application is the main application that functions to set up, monitor, and control connection.
- Remote Access Setup is a control panel device (cdev) that selects and controls the modem, and connection to a network.
- Users & Groups File uses System 7 file sharing to control access.
- Connection Document provides the information used to initiate a connection.
- Status Window shows the current status of AppleTalk Remote Access.
- Activity Log maintains a log of incoming and outgoing calls and connections.
- Network adev (Remote Only) allows you to disconnect from the local network and see only the remote network.
- Connection Control Language (CCL) scripts.
- MNPLink Tool extensions create and maintain a reliable connection.
- Security at the Macintosh and network levels.

The AppleTalk Remote Access application must be open to see the connection document, status window, and activity log. The other components are independent of the application.

Published Date: Feb 18, 2012

AppleShare 3.0: Compact Volume Access Privileges Menu

Using the Compact Volume Access Privileges menu, an administrator can perform Parallel Data Structure (PDS) compaction on a volume.
This article has been archived and is no longer updated by Apple.
PDS compaction removes PDS entries derivable from their parent, and gives dynamic access privileges. File service starts up faster after compaction. This operation is safe to do on CD-ROMs because it's impossible to drag folders to another location.
Published Date: Feb 18, 2012

AppleShare 3.0: Guest Access Default

What is the Guest access default when installing AppleShare 3.0?

This article has been archived and is no longer updated by Apple.

The default for Guest access is Off when installing AppleShare 3.0 on a new system. Upgrading a server sets Guest access to whatever it was on the existing server.

Published Date: Feb 18, 2012

AppleShare 3.0: Using Maximum Remote User Activity Meter

In AppleShare 3.0.x, the administrator can customize the response time using the Maximum Remote User Activity meter.
This article has been archived and is no longer updated by Apple.
AppleShare File Server activity affects the performance of other applications and services running on the server, and vice versa. The administrator can adjust total system performance using the Maximum Remote User Activity meter. Changes take effect immediately. The default setting is 100%.

Setting the slider to 100% allows the server to access 100% of the available CPU cycles. This doesn't lock out any other running application. Set to 50%, the server uses every other available cycle from the CPU. This is true whether an application uses the other 50% or not.

Recommended Slider Setting

It appears that there are too many variables in making a recommendation on the setting when an AppleShare file server is running in conjunction with another network service such as a print server or mail server. The optimal slider setting in this situation must be determined through trial and error.

The AppleShare 3.0.x file server keeps track of CPU usage. That is, AppleShare knows what percentage of the CPU that remote AFP requests are responsible for. Internally, AppleShare uses a complex scheduling algorithm for tracking and allotting CPU time.

The "Maximum Usage" slider controls what percentage of the CPU that remote AFP requests are allowed. So, what is actually happening when you change the value of the slider is a corresponding variable within the AppleShare scheduler is changed and is then used in scheduler time calculations to determine whether or not to process pending AFP requests.

Example: If the slider were set to 50% and it is determined (by the AppleShare scheduler) that processing another AFP request would result in AppleShare using more than 50% of the CPU and there are currently other processes competing for the CPU, then the scheduler would yield to system processes. Whereas, if the slider were set to 100%, then AFP requests are immediately processed regardless of whether there are other processes waiting for processor time.

As far a recommended settings, it totally depends on how the File/Print Server machine is being used. If it is a dedicated server, then the slider should be set a 100% for maximum server performance. If the machine is only a part time server and you wish to use the machine to run applications and so on, then the slider should be set at a lower value depending on what kind of local performance you desire.

TA47332_AppleShare_Messages_from_the_Administrator_(TIL08958).pdf

AppleShare 3.0: Messages from the Administrator

In AppleShare 3.0, the administrator can write messages up to 199 characters long, and send three message types.
This article has been archived and is no longer updated by Apple.
The three message types are:

- Greeting Message

AppleShare displays this message at log-on, to inform users of server contents, backup policies, or other news.

- User Message

The administrator can send a custom message to a User or Group.

- Disconnect User

The administrator can send a message to a group of connected users explaining the reason for shut down, or announcing the time service will be restored. The administrator can disconnect a user or group of users without bringing the server down. Disconnection can happen immediately or after a designated time interval.
Published Date: Feb 18, 2012

AppleShare 3.0: Parallel Data Structure Maintenance

Maintenance of the Parallel Data Structure (PDS) in AppleShare 3.0 is a continuous background task rather than a startup task.
This article has been archived and is no longer updated by Apple.
This change has these benefits:

- Faster server startup time

- Improved integrity of the PDS (many other applications can run on the same system, increasing the chance of a server crash)

- Ability to support removable media: The administrator can mount or unmount volumes while the server is running.

Published Date: Feb 18, 2012

AppleShare 3.0: File Server Preferences Dialog Box

The administrator can ensure network security with the choices in the File Server Preferences dialog box.
This article has been archived and is no longer updated by Apple.
Network Security Choices:

- Set the maximum number of connections. The maximum is 120 and the default is 50. Restart the server to see the new number take effect. AppleShare allocates 2K of memory at startup for each connection.

- Set the minimum number of characters in a password. Eight characters is the maximum and zero is the default.

- Set the number of days until a password expires. When the password expires, users get a prompt to enter a new word if they have the privilege to change passwords. For a temporary account, set the number of days until expiration for the duration of the account and deny the change-password privilege.

- Set the maximum number of failed log-on attempts. This disables the account when someone tries multiple random passwords to gain access. The administrator must reactivate the account.

- Require a password at startup time. This disables the "Save my name and password" option in the Chooser dialog that allows a choice of servers to mount at startup.

AppleShare 3.0: Sharing Volumes and Folders

This article discusses some of the new features of AppleShare 3.0 in terms of volume and folder sharing.
This article has been archived and is no longer updated by Apple.
You can share an entire volume, or selected folders. You can mount a maximum of 50 volumes on the AppleShare server, and share a maximum of 50 entities (volumes or folders).

When a remote user creates a new folder, the folder inherits the access privileges of the surrounding folder or volume unless the owner explicitly changes access. Access privileges used to default to owner only.

When the administrator creates a folder in an area that isn't shared or exported, the folder takes on the access privileges of the surrounding folder when dragged to a shared area. When the administrator moves this folder from the shared area to a new folder, the moved folder takes on the privileges of the new enclosing folder. Folders have this property of dynamic access privileges until the administrator assigns explicit privileges to the folder.

You can interchange Users and Groups so that a User who is not in a Group can share an entity along with the Group, and more than one User can own the same folder. A User can belong to 42 groups (up from 16). You can create over 8000 Users or Groups, but the recommended maximum is 2000.

Here are definitions for explicit and inherit access privileges:

Explicit - Retain access privileges regardless of the enclosing folder.
Inherit - Always change to reflect access privileges of enclosing folder.

The default on an AppleShare Server is explicit.

AppleShare 3.0: New Features in the User Dialog Box

This article tells about the new features added to the User dialog box.
This article has been archived and is no longer updated by Apple.
AppleShare 3.0 allows multiple super users. In the User dialog box, check the All Privileges Enabled box to give full access to all exported entities.

The User dialog box also has a Program Linking Enabled check box to allow IAC events. This dialog also controls AppleTalk Remote Access.

AppleShare Server 3.0: Product Highlights

This article highlights the most important features of AppleShare Server 3.0.
This article has been archived and is no longer updated by Apple.

Multiple Service Platform

- System 7 multitasking environment, including support for program linking and publish and subscribe.

- Includes AppleShare file and print services.

- Open environment allows additional network services.

Administrator Control

- Set number of connected users

- Send server messages to any user

- Share entire hard disks or selected folders

- Change CD-ROMs without shutting down the server

- Adjust file server performance through system caching and control over file server task prioritization

Security Enhancements

- Minimum password length

- Password aging

- Password history to prevent immediate reuse

- Ability to disallow saved passwords

- Account disable after specified number of password failures

- Adjustable time limit for temporary accounts

- Guest access turned off by default

- Copy-protection setting for documents

- "Lock" setting for folders

- Adjustable number of concurrent application launches*

- Inherited folder privileges

- Administrator log-off of any user

Print Spooling

- Spooling for up to five AppleTalk printers

- Centralized queue management

- Accepts simultaneous print requests

- Reduced user delay

- Print log for 1000 print jobs

Maximum Number of...

- Concurrent users 120

- Open files 346

- Shared volumes 50

- Users 8192**

- Groups 8192**

- Users in group 8191

- Groups per user 42

- Locked ranges per user 20

- Apple II network startups 40

AppleShare Access Privileges

- Both the user and the administrator can control access to information

- Eight different access privileges

How Users View Shared Data

- Full access privileges

- Drop folder, write capability only

- No access privileges

How Users Protect Their Data

- Can't see enclosed folders

- Can't see enclosed files

- Can't write to folder

- Can't write to or see folders

- Can't write to or see files

* Requires a multilaunch application and appropriate license agreement.

** The sum of users and groups cannot exceed 8192. The recommended limit is 2000.

System 7: Use AppleShare 2.0.2 With System Software 6.0.7

Article Change History

09/15/92 - REVIEWED
* For technical accuracy.

I have a Macintosh IIsi with system software version 7.0 installed, and I have a Macintosh SE/30 with system software version 6.0.7 and AppleShare workstation version 7.0 installed.

When I try to access the Macintosh IIsi from the Macintosh SE/30, I get the message, "Disk needs minor repairs. Do you want to repair it?" If I click the "Yes" button, the message just reappears.

This article has been archived and is no longer updated by Apple.
To correct the problem, remove the System 7 AppleShare extension from the Macintosh SE/30 running system software version 6.0.7, and replace it with AppleShare 2.0.2 workstation software from your 6.0.7 System disk.

System Software 7.0.1: Questions and Answers

Article Change History

09/24/92 - REVIEWED
* For technical accuracy.

This article gives answers to some common questions about system software version 7.0.1.

This article has been archived and is no longer updated by Apple.

Q: Why did Apple release System Software 7.0.1?
A: Macintosh System Software 7.0.1 incorporates software support for new products introduced on 21 October 1991:
- Macintosh PowerBook 100, 140, and 170
- Macintosh Quadra 700 and 900
- Macintosh Classic II

Q: Why is 7.0.1 required when using these Apple products?
A: These Apple products contain hardware features that require support from the new system software.

Q: Does Apple recommend that everyone upgrade to 7.0.1?
A: No. System 7.0.1 contains only software changes from System 7.0 necessary to support the new products and is not a generally recommended upgrade.

Q: Is System 7.0.1 available in the System 7 upgrade kits?
A: No. Because System 7.0.1 is a hardware support release only, and there is no significant benefit for other Macintosh users, the Personal Upgrade Kit won't change. Customers wishing to upgrade to System 7 can purchase an upgrade kit containing System 7.0.

However, System 7.0.1 is on the CD-ROM in the Group Upgrade kit to continue providing network administrators all versions of system software.

Q: Can I share a network between Macintosh computers running System 6, System 7.0, and System 7.0.1?
A: Yes. System 7.0.1 co-exists on networks with System 7.0 and System 6 (with updated System 7 printing software).

Q: What version of HyperCard do I need to run with System 7.0.1?
A: HyperCard version 2.1 is required for use with System 7.0.1.

Q: Does 7.0.1 address any problems with System 7.0?
A: No. Apple is very confident in the stability and compatibility of System 7.0.

Q: If I purchase a System 7 upgrade kit, am I entitled to a free copy of 7.0.1?
A: Customers wishing to get copies of System 7.0.1 can do so through electronic bulletin boards, AppleLink, or an authorized Apple dealer.

Q: How else can I get a copy of System 7.0.1?
A: System 7.0.1 is shipped in-the-box with the Macintosh PowerBook 100, 140, and 170; Macintosh Quadra 700 and 900; and the Macintosh Classic II.

For consistency, Apple also rolled over all newly manufactured systems to System 7.0.1 in the United States and Pacific.

Q: Can I get System 7.0.1 on 800K disks?
A: No. As 7.0.1 is specifically a hardware support release, 1.4MB disks only are required for the Macintosh PowerBook 100, 140, and 170; Macintosh Quadra 700 and 900; and the Macintosh Classic II.

System 7.1 through Mac OS 7.6: Compatibility With Macintosh Computers

This tables in this article list Macintosh computers and the versions of System 7.1 through Mac OS 7.6 that can be used with them. It also lists versions of any required enablers. To search the Technical Information Library for information on system software previous to 7.1 use the search string "system software and 7.0.1."
This article has been archived and is no longer updated by Apple.
Use the following chart to determine which version of system software you should be using on your Macintosh computer:

Key

! - Not supported
OK - Works with this version of system software
* - Works with this version of system software, but requires a Macintosh System Enabler (see below)

Performa 575-578	System Enabler 364	7.1P6	1.1	
Performa 600	System Enabler 304	7.1P6	1.0.1	
Performa 630-638	System Enabler 405	7.1.2P	7.1.2P	
Performa 5300	System Enabler 406	7.5.1	1.0	
Performa 6200	System Enabler 406	7.5.1	1.0	
Performa 6300	System Enabler 406	7.5.1	1.0	

Note

A - System Enabler 131 replaces System Enabler 111 and System Enabler 121

B - Express Modem users should also install the Duo Battery Patch xtension)

C - The Macintosh Plus, SE, SE/30, Classic, Classic II, LC, LC II, LC 580, Mac II, IIx, IIcx, IIsi, IIci, IIfx, Portable, PowerBook 100, 140, 145, 145B, 170, Quadra 700, 900, and 950 do NOT need a System Enabler.

D - These computers shipped with 7.5.5 and require the enabler that shipped with it. These computers do not support Mac OS 7.6 but support Mac OS 7.6.1.

PowerBook 170: Display Dimming is Normal

Sometimes I can see the display of my PowerBook 170 getting dimmer. Is this normal?

This article has been archived and is no longer updated by Apple.
Yes. This is a normal condition of the active matrix as the voltage level of the battery decreases.

Here are three levels of brightness to expect:

- With the adapter plugged in, the display is at its brightest.

- Without the adapter plugged in, the brightness drops by about 30%.

- Without the adapter, the display dims automatically at the first dialog box to about half the brightness of the display when the adapter is plugged in.

PowerBook 140 and 145: How They Differ From 170

This article compares the PowerBook 140 and 145 to the PowerBook 170, and lists the feature sets that distinguish them.

This article has been archived and is no longer updated by Apple.

Overview

The PowerBook 140, 145, and 170 computers are notebook-size Macintosh computers. These computers share the same architecture and specifications, with these exceptions: microprocessor speed, amount of on-board RAM, type of display, capacity of the internal hard disk drive, and presence of a coprocessor and an internal modem.

Common Features

The PowerBook 140, 145, and 170 computers are smaller and lighter than the Macintosh Portable and offer improved CPU performance by using a 68030 processor. They are designed to be extremely rugged and portable. Both systems are 11.25 by 9.3 by 2.25 inches and weigh under 7 pounds.

They share a common main logic board, but have different daughter boards for the processor, RAM, and ROM.

PowerBook 140 and 145

The PowerBook 140 and 145 have a 68030 microprocessor. In the PowerBook 140, it runs at 16 MHz; in the PowerBook 145, it runs at 25 MHz.

Both feature a backlit Film Supertwist Nematic (FSTN) display, and a built-in 40MB or 80MB hard disk. They do not include a socket for a 68882 floating- point unit (FPU). Expansion slots (connectors) are provided for RAM cards and modem cards.

Here are the features specific to the Macintosh PowerBook 140 and 145:

- Microprocessor: 68030 running at 16 or 25 MHz

- Coprocessor: NO 68882 FPU

- Video display: flat-panel, transmissive mode, FSTN LCD (liquid crystal display), 640 x 400 pixels, with on-demand CCFL (cold cathode fluorescent lamp) backlighting

- Hard disk: one internal 40MB or 80MB, 2.5-inch SCSI hard disk

- RAM: 2MB or 4MB

- Modem: Optional

PowerBook 170

The PowerBook 170 has a 68030 microprocessor running at 25 MHz, a 68882 FPU, backlit active matrix display, and built-in 40MB hard disk and 2400 baud modem (USA only). Expansion slots (connectors) are provided for RAM cards and modem cards.

Here are the features specific to the Macintosh PowerBook 170:

- Microprocessor: 68030 running at 25 MHz

- Coprocessor: 68882 FPU

- Video display: flat-panel, transreflective Active Matrix LCD (liquid crystal display), 640 x 400 pixels, with on-demand CCFL (cold cathode fluorescent lamp) backlighting

- Hard disk: one internal 80MB, 2.5-inch SCSI hard disk

- Modem: one internal 20-pin connector with 2400 baud modem card installed; send facsimile capability (USA only, international decision on a country-by-country basis)

PowerBook Fax/Data Modem: Specifications (6/92)

This article gives the hardware specifications for the Macintosh PowerBook Fax/Data Modem, provided in the "Macintosh PowerBook Fax/Data Modem Developers Guide", which is available from APDA.

This article has been archived and is no longer updated by Apple.

Fax Compatibility
---
* Group 3 only

Data Format

The data format to use is determined by the software application.

* Protocol: serial, binary, asynchronous
* Parity: odd, even, mark, space, or no parity
* Character length:
* 7 data bits, 1 parity bit (even, odd, mark, or space parity), and 1 stop bit
* 7 data bits, no parity, 2 stop bits
* 8 data bits, no parity, and 1 stop bit

Frequency Tolerance
---
* Offset frequency: +/-7 Hz

Data Transmission Modes
---
* Full duplex
* Asynchronous

Fax Transmission Modes
---
* Half duplex

Compatibility and Modulation
---
* Full duplex (data communication standards)

Speed Standard Modulation
--- --- ---
300 bps Bell 103 FSK
1200 bps Bell 212A DPSK
1200 bps CCITT V.22 DPSK
2400 bps CCITT V.22bis QAM

* Half Duplex (fax communications standards)

Speed Standard
--- ---
2400-4800 bps CCITT V.27ter
7200-9600 bps CCITT V.29

Transmit Carrier Frequencies
---
* V.22bis, V.22, Bell 212A Transmit Carrier
Originate 1200 Hz
Answer 2400 Hz

* Bell 103 Mark Space
Originate 1270 1070
Answer 2225 2025

* V.21 Mark Space

Originate 980 1180
Answer & Fax 1650 1850

* V.29 Carrier 1700 Hz

* V.27 Carrier 1800 Hz

Guard Tone Frequencies and Transmit Levels (CCITT only)
---
* 1800 Hz +/-20 Hz 6 +/-dB below the transmit carrier level
* 550 Hz +/-20 Hz 3 +/-dB below the transmit carrier level

Answer Tone Frequency
---
* V.22bis, V.22, V.21, and fax 2100 Hz
* Bell 103, Bell 212A 2225 Hz

Received Signal Frequency Tolerance
---
* Offset frequency: +/-7 Hz

Calling Tone
---
* Fax-specific calling tone: 1100 Hz (0.5s on, 3s off with 15% tolerance)

V.42bis and MNP Features
---
* V.42bis and MNP protocols for error correction and data compression apply to V.22, Bell 212, and V.22bis

Error Control
---
* MNP Classes 2 to 4
* CCITT V.42

Data Compression
---
* MNP Class 5
* CCITT V.42bis

These protocols apply to V.22, V.22bis, and Bell 212 (if available in your country)

Features
---
* Auto-dial and auto/manual answer
* Dual-tone multifrequency (DTMF)/pulse dialing
* Extended AT command set
* Low-power design to help preserve Macintosh PowerBook battery power

Operating Environment
---
* Ambient temperature: 38 to 125 degrees F (5 to 65 degrees C)
* Relative humidity: up to 95% (non-condensing)
* Optimal humidity range: 0 to 75%

Power Requirements
---
* +5V +/-5% supplied by Macintosh PowerBook
* -5V +/-5% supplied by Macintosh PowerBook

Power Consumption
---
* Operational mode: 750 mW typical

* Macintosh PowerBook sleep state: 0 mW

Electrical Requirements
---
* Line voltage: 110 to 220 volts
* Frequency: 50 to 60 Hz

Physical Characteristics
---
* Board for internal installation with one mini-DIN connector and external RJ11 jack
* Modem size: 96x36 mm

PowerBook: Apple Peripheral Products (7/92)

This article gives brief descriptions of peripheral products for the Macintosh PowerBook computers.

This article has been archived and is no longer updated by Apple.

Memory Expansion Kits

Macintosh PowerBook memory expansion kits increase system memory to work with advanced Macintosh applications, with or large spreadsheets, scanned images, and sound files. The 2MB and 4MB memory expansion kits expand any Macintosh PowerBook computer to a system with up to 6MB of RAM. Dealer installation is required.

Fax/Data Modem

The Fax/Data Modem allows information exchange with other computers, and sends facsimile transmissions. Communicate with any standard modem operating at 2400, 1200, or 300 baud, and send facsimiles at 9600 baud. This low-power modem fits inside the PowerBook 100, 140, and 170, and can operate unattended for receiving files while you are away from the computer. Two versions are available: one for use in the U.S., Canada, and Japan, and one for use in Europe, Australia, and some South American countries. Dealer installation is required.

HDI-20 External 1.4MB Floppy Disk Drive

The Macintosh HDI-20 External 1.4MB Floppy Disk Drive gives the PowerBook 100 access to high-capacity disk storage including 400K, 800K, and 1.4MB Macintosh- and DOS-formatted disks. It plugs directly into the computer's floppy disk drive port.

Apple HDI-30 SCSI Disk Adapter and System Cable

The Apple HDI-30 SCSI Disk Adapter allows you to use a Macintosh PowerBook 100 computer as an external hard disk with another Macintosh system, for high-speed file transfer or system recovery.

The Apple HDI-30 SCSI system cable connects a PowerBook 100, 140, or 170 to any SCSI peripheral device, such as a CD-ROM drive, scanner, tape backup, or hard disk. You can connect up to five SCSI devices to the PowerBook at once, allowing a total of seven devices on the SCSI chain.

Rechargeable Batteries

The Macintosh PowerBook 140/170 rechargeable battery is a nickel-cadmium battery that provides two to three hours of use for the PowerBook 140 and PowerBook 170 notebook computers before recharging. You can recharge it hundreds of times before it needs replacing.

The Macintosh PowerBook 100 rechargeable battery is a sealed lead-acid battery that provides two to four hours of use. It can be fully recharged hundreds of times before it needs replacing.

Battery Rechargers

The Macintosh PowerBook 140/170 battery recharger recharges one or two nickel-cadmium batteries for the PowerBook 140 or PowerBook 170 computer to full power in just a few hours. An AC adapter (see below) is required.
The Macintosh PowerBook 100 battery recharger recharges the sealed lead- acid battery to full power in a few hours. It charges two batteries at once. An AC Adapter (see below) is required.

AC Adapter

The Macintosh PowerBook AC Adapter recharges batteries without having to unplug and remove the computer's adapter. Additional adapters make it easy to use a PowerBook computer at different locations. You can use it in any country without transformers; it needs just a simple plug adapter.

PowerBook 140 and 145: Description (7/93) (Discontinued)

This article describes the Macintosh PowerBook 140 and 145 notebook computers. The only difference between the 140 and the 145 is the clock speed of their 68030 microprocessors. Note that the PowerBook 145B is functionally equivalent to the 145; in most cases a reference to the PowerBook 145 also applies to the 145B.

Note: With the PowerBook 145 and System 7.0.1, when you choose About This Macintosh... from the Apple menu, you'll see a window labeled "PowerBook 140". System 7.1 corrects this.

This article has been archived and is no longer updated by Apple.
The Macintosh PowerBook 140 and 145 fit easily inside a briefcase. They're ergonomically designed with an integrated trackball and palm rest to work with easily on your lap. You can adjust the standard-size keyboard and full page-width display.

The PowerBook 140 and 145 offer greater performance than the PowerBook 100. They have a built-in floppy disk drive that accommodates Macintosh, MS-DOS, OS/2, and ProDOS formats.

Built-in features:

* Networking capability that gives access to all the resources in an AppleTalk network.

* Six built-in ports to plug the PowerBook 140 or 145 directly into high-capacity hard disks, printers, and input devices.

* An optional modem sends electronic mail, accesses information on other computers, connects to an AppleTalk network, and sends documents to facsimile machines.

* Built-in sound-input capability.

* Processor: 16 MHz 68030 microprocessor (PowerBook 140)
25 MHz 68030 microprocessor (PowerBook 145)

* 2MB (on the 140) or 4MB RAM, expandable to 8MB

* Expansion: Six built-in ports for peripherals
Internal slots for modem and RAM

* Display: Backlit Supertwist, 640 by 400 pixels

* System Software 7.1, with multitasking, file sharing, Balloon Help, and TrueType fonts

* Networking: Built-in AppleTalk networking
File sharing without a dedicated server

* Compatibility: Macintosh, MS-DOS, OS/2, and ProDOS floppy disk formats

Article Change History:
14 July 1993 - Updated to include PowerBook 145B.

PowerBook 140: Specifications (Discontinued)

This article gives technical specifications for the Macintosh PowerBook 140 notebook computer.

This article has been archived and is no longer updated by Apple.

Microprocessor
---
* 68030, running at 16 MHz

Address and Data Bus

32-bit Address Bus
32-bit Data Bus

Memory
---
* Comes with 2MB or 4MB pseudostatic RAM on the logic board and one memory expansion slot.

* Expandable to 8MB of RAM by installing a RAM expansion card in the expansion slot.

Disk Storage
---
* One built-in 1.4MB drive that uses high-density floppy disks; it reads, writes, and formats Macintosh, MS-DOS, OS/2, and ProDOS disks.

* One internal 40MB or 80MB hard disk

Display
---
* 10 inch (254 mm) diagonal

* Backlit Supertwist liquid crystal display

* 640 by 400 pixels

Battery
---
* NiCad, 2.5 ampere-hours, provides 2 to 3 hours of use before recharging is necessary

* Recharge time: 100% recharged after 5 hours; 80% recharged after 3 hours

Keyboard
---
* Built-in keyboard with standard Macintosh layout

* Two-level tilt adjustment

Trackball
---
* Dual-button trackball, 30 mm diameter,

Clock/Calendar
---
* CMOS custom chip with long-life lithium battery

Interfaces
---
* One Apple Desktop Bus (ADB) port for keyboard, mouse, and other devices using a low-speed, synchronous serial bus

* Two RS-422 serial ports for LocalTalk networking, printers, modems, and other devices

* One HDI-30 SCSI port for hard disks, scanners, CD-ROM drives, and other devices

* One sound output port for external audio amplifier

* One sound-in port

Modem
---
* Optional internal 2400-baud modem with facsimile send at 9600 baud; includes facsimile send software

* Error correction and compression: MNP 4, 5 and V.42, V.42bis

Sound Generator
---
* Apple Sound Chip provides 8-bit sound, capable of driving stereo headphones or other stereo equipment through the sound port.

Sound Input
---
* 8-bit sound, sampled at 11 or 22 kHz

Disability Access
---
* CloseView, Easy Access, and visible beep included with system software. These built-in solutions and third-party options provide alternative input and output devices for people with disability.

ADB Power Requirements
---
* Maximum current draw for all ADB devices is 200 milliamps (a maximum of three ADB devices is recommended)

Electrical Requirements
---
* Line voltage: 100 to 240 volts

* Frequency: 50 to 60 Hz

Environmental Requirements
---
* Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)

* Storage Temperature: -40 to 65í C (-40 to 148í F)

* Relative humidity: 20% to 80% noncondensing

* Altitude: Operating: 3048 m (10,000 ft.) maximum
Shipping (non-operating) 0 to 15,000 ft. (0 to 4,722 m)

Size and Weight
---
* Height 2.25 inches (5.7 cm)
* Width 11.25 inches (28.6 cm)
* Depth 9.3 inches (23.6 cm)
* Weight 6.8 lb (3.03 kg)

Noise Level

Noise free except for floppy or hard disk use.

Article Change History
---
22 Mar 1995 - Updated operating and shipping altitude ratings.
02 Jun 1993 - Updated to correct voltage specification.
19 Feb 1993 - Updated to correct storage temperature range.

PowerBook 170: Description (8/92) (Discontinued)

This article describes the Macintosh PowerBook 170 notebook computer.

This article has been archived and is no longer updated by Apple.
The Macintosh PowerBook 170 offers high performance and flexibility and is small enough to fit inside a briefcase. It includes a CPU, full-size screen and keyboard, trackball, battery, and disk storage.

It is comfortable to work with because of its integrated trackball and palm rest, and you can adjust the standard-size keyboard and full-page-width screen. It runs applications up to 50 percent faster than the PowerBook 140. It comes standard with 4MB of RAM and a built-in modem.

The PowerBook 170 provides the connections for built-in networking and six built-in ports for access to high-capacity hard disks, printers, and input devices.

The built-in modem sends electronic mail, accesses information on other computers, connects to an AppleTalk network, and sends documents to facsimile machines. It has built-in sound input to include sounds from different sources.

Macintosh PowerBook 170 Features

- Processor: 25 MHz 68030 microprocessor
25 MHz 68882 math coprocessor

- Memory: 4MB of RAM, expandable to 8MB

- Expansion: Six built-in ports for peripherals
Internal slots for modem and RAM

- Display: Backlit active matrix, 640 by 400 pixels

- Modem: 2400-baud data, 9600-baud facsimile send

Features Built Into Every Macintosh

- Usability: Runs thousands of Macintosh applications

- System software: System 7.0.1, with multitasking, file sharing, Balloon
Help, and TrueType fonts

- Networking: Built-in AppleTalk networking
File sharing without a dedicated server

- Compatibility: Macintosh, MS-DOS, OS/2, and ProDOS floppy disk formats

AppleShare: Copy-Protection and Locked Files or Folders

This article has been archived and is no longer updated by Apple.

AppleShare 1.0 and 1.1

AppleShare 1.0 and 1.1 do not provide a mechanism to prevent users from copying files from an AppleShare volume.

Locking folders with these versions will not prevent someone from moving the folder elsewhere on the volume.

AppleShare File Server 2.0 or Later

You can Lock folders but you cannot copy-protect them. Locking prevents renaming, discarding, or moving the folder elsewhere on the volume. Locking does not affect access privileges. Only the folder's owner can enable or disable the folder lock option from the Access Privileges window.

Files can be locked and/or copy-protected. Locking a file prevents renaming, discarding, or saving any changes to the file but does NOT prevent someone from moving, copying, or opening the file. You can lock a file from the finder within the Get Info window.

When a file is copy-protected, users are unable to copy or duplicate it in the finder. Users with acess privileges could still open a copy-protected document and using the Save As function could make a copy of the document -- defeating the copy protection.

The copy-protection feature is most useful for preventing copying of applications, to comply with copyrights and licensing agreements. Copy-protection can only be set with AppleShare Administration software within the file information window.

Published Date: Feb 18, 2012

PowerBook 100: How it Differs from Macintosh Portable (8/92)

This article describes the Macintosh PowerBook 100 features and how they differ from those of the Macintosh Portable.

This article has been archived and is no longer updated by Apple.

The Macintosh PowerBook 100 is the entry-level notebook Macintosh. It has many of the features of the Macintosh Portable, but in a lighter and smaller enclosure. The main differences are that the PowerBook 100 does not have a processor direct slot, ROM expansion slot, internal floppy drive, nor an external modem serial connection. The display is Supertwist instead of active matrix display.

The Macintosh PowerBook 100 has a new feature, SCSI disk mode. This mode allows another Macintosh to mount the internal hard disk drive. This mode requires a special SCSI disk mode adapter. The ROM contains the firmware for this mode. No other Macintosh has this feature.

The basic performance is the same as the Macintosh Portable. This is approximately twice the performance of a Macintosh Classic.

Published Date: Feb 18, 2012

PowerBook 100: Description (8/92) (Discontinued)

This article describes the Macintosh PowerBook 100 notebook computer.

This article has been archived and is no longer updated by Apple.
The Macintosh PowerBook 100 is small enough to fit in a briefcase, yet gives you the use of applications on a Macintosh. The self-contained trackball and palm rest allow you to work anywhere. You can adjust the bright display and the standard-size keyboard to work in any environment.

Built-in networking allows access to an AppleTalk network. Five built-in ports give you plug-and-play connections to high-capacity hard disks, CD-ROM drives, printers, and input devices. With the external floppy disk drive, you can work with data files stored in Macintosh, MS-DOS, OS/2 and ProDOS formats. The optional modem allows you to send electronic mail, access information on other computers, and send documents to facsimile machines.

Macintosh PowerBook 100 Features

- Processor: 16 MHz 68HC000 microprocessor

- Expansion: Five built-in ports for peripherals
Internal slots for modem and RAM
Optional SCSI disk adapter allows the computer to be used as
an external hard disk.

- Usability: Runs thousands of Macintosh applications
Easy to set up, learn, and use

- System software: System 7.0.1, with multitasking, file sharing, Balloon
Help, and TrueType fonts

- Networking: Built-in AppleTalk networking
File sharing without a dedicated server

- Compatibility: Macintosh, MS-DOS, OS/2, and ProDOS floppy disk formats

PowerBook 100: Specifications (Discontinued)

This article gives technical specifications for the Macintosh PowerBook 100 notebook computer.

This article has been archived and is no longer updated by Apple.

Microprocessor

68HC000, running at 16 MHz
Address Bus: 24-bit
Registers (32-bit): 17
Addressing Modes: 14

Memory

- Comes with 2MB pseudostatic RAM on the logic board, and one memory expansion slot.

- Expandable to 8MB of RAM by installing a RAM expansion card in the expansion slot.

Disk storage

- One internal 20MB SCSI hard disk

- External 1.4MB floppy disk drive; reads, writes, and formats Macintosh, MS-DOS, OS/2 and ProDOS disks

Display

- 9 inch (229 mm) diagonal

- Backlit Supertwist liquid crystal display

- 640 by 400 pixels

Battery

- Sealed lead-acid, 2.3 ampere-hours, provides 2 to 4 hours of use before recharging is necessary

- Recharge time: 3 hours

- Three non-rechargeable disk-type Lithium backup batteries (type CR-2430)

Keyboard

- Built-in keyboard with standard Macintosh layout

- Two-level tilt adjustment

Trackball

- dual button trackball, 25 mm diameter

Clock/calendar

- CMOS custom chip with long-life lithium battery

Interfaces

- One Apple Desktop Bus (ADB) port for low-power keyboard, mouse, and other devices using a two-speed, synchronous serial bus

- One RS-422 serial port for LocalTalk networking, printers, modems, and other devices

- One HDI-30 SCSI port for hard disks, scanners, CD-ROM drives, and other devices

- One monophonic sound output port for external audio amplifier

- One HDI-20 floppy disk drive port for the external 1.4MB floppy disk drive

Modem

- Optional internal 2400-baud data modem with facsimile at 9600 baud; includes facsimile send software

- Error correction and compression: MNP 4, 5 and V.42, V.42bis

Sound generator

- Apple Sound Chip provides 8-bit sound capable of driving headphones or other stereo equipment through the sound port.

Disability Access

- CloseView, Easy Access, and visible beep included with system software. These built-in solutions and third-party options provide alternative input and output devices for people with disability.

ADB Power Requirements

- Maximum current draw for all ADB devices is 200 milliamps (a maximum of three ADB devices is recommended)

Electrical Requirements

- Line voltage: 100 to 240 volts

- Frequency: 50 to 60 Hz

Environmental Requirements

- Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)

TA47353_PowerBook_Support_Issues__(TIL08983).pdf

PowerBook 100: Support Issues (8/92)

This article discusses some of the support issues for the Macintosh PowerBook 100.

This article has been archived and is no longer updated by Apple.

Hard Disk Recovery

The low end marketing bundle does not include an external floppy disk drive. File sharing or SCSI disk mode will transfer data to and from a desktop Macintosh.

If you rely only on file sharing for file transfer, you may not be able to recover the internal hard disk drive. For example, if the System Folder is corrupted or the hard disk needs repair, file sharing can't connect to the Macintosh PowerBook 100. You need a SCSI disk adapter cable or an external floppy disk drive to connect.

Hard Disk Interleave Factor Mismatch

If another Macintosh initializes the hard disk while the Macintosh PowerBook 100 is in its SCSI disk mode, it may set the interleave factor incorrectly for the PowerBook 100. The PowerBook 100 has an interleave factor of 1. If, for example, a Macintosh Classic initializes the hard disk drive over SCSI disk mode, the default is an interleave factor of 3. This causes some inefficiencies when accessing the hard disk drive.

To work around this, you can force the Hard Disk Setup Utility to initialize with an interleave factor of 2. Type Command-I when the application is open. This brings up a dialog box that allows you to change the interleave factor.

No Support of System Peripheral Cable for File Sharing

This is an old issue from the days of connecting a LaserWriter to a Macintosh in a non-networked environment. You can't use the peripheral cable (Mini DIN-8 to Mini DIN-8, M0197) for connecting AppleTalk devices. You can use a peripheral cable in a point-to-point connection instead of two AppleTalk drop boxes and the cabling. This is a lower-cost solution, but Apple has not tested this configuration and does not guarantee future compatibility of this method for connecting two AppleTalk devices.

TA47354_Macintosh_Quadra_Support_Issues_(TIL08986).pdf

Macintosh Quadra 700: Support Issues

This article discusses some of the Quadra 700 support issues.

This article has been archived and is no longer updated by Apple.

Processor Cooling

The Quadra 700 is designed with special cooling considerations for the 68040. For the processor to cool properly, the case must be closed whenever the Quadra 700 is running.

VRAM Bank Order

The VRAM banks must be populated in order. If there is a VRAM upgrade, the SIMM slots should be populated from the back of the CPU to the front.

SIMM Slots

The placement of the SIMM slots under the hard drive makes it unlikely that vendors will be able to develop 16MB SIMMs to work on this computer.

Published Date: Feb 18, 2012

Macintosh Quadra 900: Support Issues

This article discusses some of the support issues for the Quadra 900.

This article has been archived and is no longer updated by Apple.

Sound

The existing sound input is 8-bit linear PCM with analog limiting to enhance the power of the signal being digitized. The sample rate may be set for 22 kHz or 11 kHz. Therefore, the results will not be significantly better than a low cost cassette recorder without noise reduction. This level of performance is adequate for voice annotation, but will not produce the best results with music.

Long Memory Checks

When you install large amounts of DRAM, the memory check at startup is lengthy and you may think the machine isn't functioning. There is no message saying that the machine is running memory checks.

Processor Cooling

The Quadra 900 is designed with special cooling considerations for the 68040. For the processor to cool properly, the case must be closed whenever the Quadra 900 is running.

ProDOS: Error 900 When Using Apple IIc Sys Utilities Disk

I started up my system with the Apple IIc System Utilities Disk. This disk has a new port configuration saved to it. If I select any menu option then press the Escape key to return to the main menu, I always drop into the monitor with Error #900 displayed. How can I get around this?
This article has been archived and is no longer updated by Apple.
The workaround is as follows:

1. Duplicate your Systems Utilities disk: select the main menu option 5. Boot your system with this new copy.

2. Select main menu option 9 to exit from System Utilities.

3. From the Basic prompt, type in the following:

Load SU,S6
List 900

You will see the listing: 900 Call 768: Poke 216,0: Onerr Goto 930

4. Change line 900 to: 900 Poke 216,0: Onerr Goto 930: Call 768

5. Enter the following commands to unlock the file, save the changes to disk and relock the file to prevent accidental damage: List 900

6. Check once again that line 900 reads properly as in step 4, then type:

Unlock SU,S6
Save SU,S6
Lock SU,S6

TA47357_Macintosh_Classic_II_Support_Issues_(TIL08990).pdf

Macintosh Classic II: Support Issues

This article discusses some of the support issues for the Macintosh Classic II.

This article has been archived and is no longer updated by Apple.

No FPU from Apple

Apple does not plan to produce an FPU card for the Macintosh Classic II.

No A/UX

There are no plans for a version of A/UX that runs on the Macintosh Classic II.

Published Date: Feb 18, 2012

Macintosh Classic II & Macintosh Classic:Comparison (8/96)

This article describes enhancements in the Macintosh Classic II, as compared to the Macintosh Classic.

This article has been archived and is no longer updated by Apple.

Processor

The Macintosh Classic II uses a 68030, 16 MHz CPU, while the Macintosh Classic has a 68000, 8MHz CPU.

RAM

The Classic II comes with 2 MB of RAM and two standard 32-pin SIMM sockets to add RAM configurations of 2, 4, 6 or 10 megabytes using standard SIMM modules with 100ns or better access time. The Macintosh Classic can have a maximum of 4 MB of RAM.

ROM

The Macintosh Classic II ROM is a modified version of the Macintosh LC ROM that supports virtual memory and 512 pixels x 342 pixels x 1 bit video. It comes with a 512K ROM, expandable to 4 MB using the on-board FPU/ROM connector.

Analog Board

These are the changes made to the Macintosh Classic analog board for use in the Macintosh Classic II:

- The width adjust coil replaced by a potentiometer.

- A new low-radiation flyback transformer added.

Other Differences

The Macintosh Classic II comes with a microphone for sound input.

The Macintosh Classic II has a connector on the logic board that allows you to add a floating-point coprocessor, available from third parties.

The Macintosh Classic II has a monitor yoke with opposing windings (cancellation coils). It requires system software version 7.0.1, and comes in configurations of 2 MB RAM with a 40 MB hard disk, or 4 MB of RAM with an 80 MB hard disk.

Apple IIe Card: Compatible Monitors and Projection Pads

What Apple monitors work with the Apple IIe Card?

Can I use an LCD projection pads with the IIe card?

This article has been archived and is no longer updated by Apple.

Monitors

The Apple IIe Card supports the following monitors:

- Macintosh 12-inch RGB Display
- Macintosh 12-inch Monochrome Display
- AppleColor 13-inch High Resolution Monitor
- Apple 13-inch Monochrome Monitor
- IBM VGA monitors (those that work with the Macintosh LC, with the correct cable)

In other words, Apple IIe Card supports all monitors that are supported by the Macintosh LC video, including the 13-inch color monitor.

Projection Pads

As for LCD Projection Pads, we have only tried the nView ViewFrame II+2. It works with both the 13-inch and the 12-inch monitor. 13-inch projection pads should work, if you have a 13-inch monitor hooked up in-line with the projection pad cable.

Most pads provide a DB-15 female connector to plug into your monitor. The video that the Macintosh LC sends out is based on the monitor sense pins. If the projection pad can support many different video types, it should work also with a 12-inch monitor connected.

If you have a pad, test it with both the 12-inch and 13-inch monitors. If it works with both monitors, it should work with the Apple IIe card. If the pad has problems with the 12-inch monitor, then it also will have problems with the IIe card.

Published Date: Feb 18, 2012

Apple IIe: How to Limit Access to the Option Panel

I need to limit access to the Apple IIe Option Panel in my school lab.

This article has been archived and is no longer updated by Apple.
You can do so by buying an optional jumper for the Macintosh LC Logic Board. When the jumper is installed on the Macintosh LC logic board, users retain access to these Apple IIe Option Panel buttons:

- Quit IIe
- Eject Disk
- Restart IIe
- Return

However, users will not have access to any of the panels used to change Option Panel settings.

After shutting off the machine and all connected peripherals, put the jumper on the logic board near the battery. There are three sets of pins on the connector. Place the jumper on the pins closest to the battery (labeled CPE or W1 on the board).

This jumper also exists on the Macintosh LCII and Performa 405. However the designation is J17 not CPE.

Article Change History:
21 Jun 1994 - Added information on the LCII and Performa 405.

Apple II, IIe and II+: Auto-Run Apple w/o DOS

Some applications require that an Apple start running an Applesoft program from power-up without human interaction. This is easy with the disk and Auto-Start ROM. Simply initilaize the diskette with the desired program in memory and the disk will boot and run it when the power comes on. But sometimes a disk drive is undesirable, especially where there is only one program to run and the cost must be kept low. So here is a way to have a card that will load and run an Applesoft program automatically on power-up in any Apple II+.
This article has been archived and is no longer updated by Apple.
I will assume the use of a card like the Mountain Computer ROM+ that has a 256 byte "control ROM" and room for some larger ROMs to store the Applesoft program. On the ROM+ this is a bank of up to six 2716 type EPROMs. Using EPROMs has the advantage that you can change your Applesoft program later by erasing the EPROMs and reprogramming and the disadvantages of higher cost and using more power from the Apple's power supply. The power consumption of the EPROMs won't be a problem if the Apple isn't filled with cards.

The software in the control ROM is required to do five things:

1. Pretend that it's a disk controller card so that the Auto-Start ROM will execute its code.
2. Initialize Applesoft.
3. Move an image of the Applesoft program down from the ROMs into the proper area of RAM.
4. Set up the required Applesoft pointers for the end of the program.
5. RUN the program.

All that's needed to convince the Auto-Start that there's a disk controller card out there is to have a ROM whose first four odd bytes match the Apple P5 or P5A PROM. If the monitor finds a ROM that matches it in slot N, it will do a jump to $CN00. The routine that does this starts at $FAA6 and is listed on page 144 of the Apple II reference manual.

The first eight bytes in the control ROM will be: 24 20 24 00 24 03 24 3C

Note: By having the even numbered bytes equal to $24, (BIT Page zero) when the code is executed starting at $CN00 nothing will happen until the byte after the $3C.

The proper way to initialize Applesoft is to jump to $E000. Unfortunately this entry into Applesoft falls into the normal command level routine. o regain control so that the control ROM can load a program we can use the same trick that DOS uses. As soon as Applesoft reaches its command level it prints a prompt, ("]") and waits for the user to type in a command. Since all input and output in the Apple is handled through two pointers in RAM, we can divert the input routine to point back into the control ROM. This will leave several levels of subroutine on the 6502 stack but Applesoft will re-initialize the stack when we RUN the program so it doesn't matter.

Now the question becomes what address to put into the pointer. The control ROM's address will change depending on which peripheral slot it's plugged into.

The low byte is just the offset from the start of the ROM since the address always starts on a 256 byte boundary but the high byte could be anything from $C1 to $C7. When the Auto-Start ROM looks for a disk controller card it saves the high order byte in $7F8. So the contents of $38 and $39, the input pointer, becomes the offset which is stored at location $7F8. Then we can jump to $E000 to initialize Applesoft confident that we will regain control when it's done.

For the next step a copy of the image of the application program needs to be programmed into the EPROMs. The program starts at the address pointed to by $67 and $68 and ends at the address pointed to by $AF and $B0. The contents of the end address pointer, $AF and $B0, will be inserted in the control ROM at locations $1F and $23. When control comes back through the input routine pointer, Applesoft has already initialized $67 and $68. So the next step is to move the image of the Applesoft program down to where it originally came from. How this is done will depend on the hardware of the ROM card and the length of the Applesoft program. If you use the Apple firmware card you will have to address the soft switch to select the firmware card and then address the switch again to re-select the Applesoft ROMs. With the ROMPLUS it could be as simple as using the monitor move routine, $FE2C, to move a program of less than 2 kilobytes long.

There is a little more initialization to be done before the Applesoft program can be RUN. The end of program pointer mentioned earlier must be put into $69 and $6A and one more Applesoft routine must be called. Unfortunately this one also drops into Applesoft's command mode so we have to modify the input pointer again to point to a third part of the control ROM. Once this is done the final initialization can be done with a jump to $D4F2.

And now the final part, we need to reset the input pointer so that the program can input normally from the keyboard and actually RUN the program. To make things easier there is a routine set by the Auto-Start ROM that will set the input pointers to the keyboard at location $FE89. Then all that's left to do is jump to $D566 which will run the program.

For a bit of finesse, if we put a $80 into location $D6, the user will not be able to list the program. In fact any attempt to do any Applesoft command except LOAD from cassette will cause the program to RUN. Also, by changing the reset vectors in the Auto-Start ROM to point to the RUN routine, the program will become very difficult to stop or modify.

(To change the reset vector, load memory starting at $3F2 with 66 D5 70. See page 36 and 37 of the Apple II Reference manual for more details)

THE LISTING

This listing is all done relative to the start of the ROM so all address are given as one byte. If you use an assembler, simply origin the code in RAM and when it is programmed into the control ROM it will work just fine. The routines are not arranged in order of execution so that the move routine will be at the end since the length of the move routine will vary with the hardware requirements. Just be sure that the three byte jump is inserted behind the move routine.

Lisa 7/7 (version 3.0): "UNABLE TO PRINT" message

This article has been archived and is no longer updated by Apple.
When your Lisa informs you it's having difficulties printing your document, check everything suggested by both the dialog message and the manual, and then try the following.

1. Open Preferences and click on Connect devices. Select each of the connections (e.g., Serial A Connector), and set each to Nothing.

2. Re-select each of the connecions in Connect Devices, and select what you physically have connected to the Lisa at that connection.

3. Click on Select Defaults in Preferences and make your printer the default printer.

4. Open your document and choose Format for Printer from the File/Print menu. Click on the "New Printer..." button, then select a printer different from what is currently selected (a new default printer). Finally, select Format for Printer and choose the printer you wish to print the document on.

AppleShare Print Server: -120 Error

I am having problems with an AppleShare Print Server IINTX. When any of the workstations try to print to the network LaserWriter, the print server instantly aborts the print job. After this, the printer must be reset to be re-captured.

A message comes up on the screen stating that the computer is trying to clear the print buffer. I also get a message stating that error number -120 has occurred. The print server is a Macintosh SE 2/40, and the workstations are Macintosh SE 20s. I have re-installed System software, print-server software, LaserWriter files, and Laser Prep files on both the file server and workstations. What else can I do?

This article has been archived and is no longer updated by Apple.
The -120 error is a "directory not found" error that could be related to a hardware failure on the server. ?If you can print to the LaserWriter IINTX via the bypass feature of the AppleShare Print Server, then there is a problem at the server level. It is most important to determine that the workstations can print to the IINTX on bypass to verify the integrity of the hardware.

Here are two things to try on the server:

1) If you reinstalled the software over the old files, trash the old files first and then re-install.

2) Second, consider backing up the server in a file-by-file manner, re-initializing the drive, and restoring the files. The print server may be running into some bad sectors which inhibit its ability to spool the files.

Macintosh Manager: Third-Party Application Allows Access to Restricted Area

Some third-party applications used in a Macintosh Manager environment may allow users access to areas of the file system from which Macintosh Manager would normally restrict them.
This article has been archived and is no longer updated by Apple.

Symptom

Using certain applications in a Macintosh Manager environment, users have access to an area of the file system that would otherwise be restricted by Macintosh Manager. This may occur through an open or save dialog box. It might also happen, for example, in the Recent Items feature of a word processing application.

Solution

Macintosh Manager limits calls for file system access that an application makes when the application uses standard Mac OS system calls. If a third-party application uses proprietary (nonstandard) calls for access, Macintosh Manager used with Mac OS 8.x does not limit them.

There are two solutions for administrators whose users are affected by this issue:

- Update affected client computers to Mac OS 9.x. Mac OS 9 used with Macintosh Manager restricts proprietary calls in addition to standard calls.
- Contact the maker of the application software to check for updates to the affected application or to request that one be released.

Published Date: Feb 18, 2012

Macintosh Manager, Multiple Users: Users Folder Created on All Volumes

Macintosh Manager or Multiple Users creates a Users folder on all available volumes, including removable media.
This article has been archived and is no longer updated by Apple.
Macintosh Manager or Multiple Users used with any version of Mac OS 9.x creates a Users folder on each available volume. An affected volume may be a piece of writable removable media (such as an Iomega Zip disk, but not a CD-ROM), a hard disk or partition, or a remote volume that appears on the desktop. This Users folder will have the same permissions as the Users folder located in the Macintosh Manager shared folder located on the startup disk of the Macintosh Manager server.

For related information, please see:

Article 31228: "**Mac OS: Limited Access to Folder Named 'Users'**"

This is a normal behavior for Mac OS 9.x and for Macintosh Manager.
Published Date: Feb 18, 2012

Macintosh Manager 1.3: Mac OS 7.6.1 Clients Lose Documents

A Mac OS 7.6.1 Macintosh Manager client may log in to find that his documents are no longer available. When you check on the Server, the user's Documents folder is empty.
This article has been archived and is no longer updated by Apple.

Symptom

Your documents folder is empty.

Solution

Download and install Macintosh Manager 1.4 or later. It is available from Apple Software Updates.

If updating to version 1.4.1 does not resolve the issue, try these additional steps:

1. Update to AppleShare Client 3.8.3.
2. Update to Open Transport 1.1.2.
3. Check which Ethernet card is installed (Apple or third-party). If it's a third-party card, check with the vendor to see if there are any driver updates.
4. Try Extensions troubleshooting as described in technical document 30929, "Mac OS: Extension Conflict Troubleshooting/Extensions Manager Features".
5. Isolate your setup (server and clients) from the larger network and test again.

Published Date: Feb 18, 2012

AppleShare IP 6.3: Troubleshooting Stability Issues

This article offers a list of troubleshooting steps for an AppleShare IP 6.3 or later server that stops responding ("freezes").
This article has been archived and is no longer updated by Apple.

Symptom

The operation of the AppleShare IP 6.3 server is unstable and sometimes stops responding ("freezes").

Solution

This issue may be resolved by installing the AppleShare IP 9.0.4 Update, available from Apple Software Downloads (http://www.apple.com/swupdates/). Alternatively, you may install AppleShare IP 6.3.3. Both contain the same software to address the issue. If this does not help, try the following:

Update Software

First, make sure the server (and the clients) have the appropriate system software. See technical document 16145: "**AppleShare: Platforms and Mac OS Releases Supported**"

Use the table below to check that the following updates are installed:

Computer	Updates
Power Macintosh (Blue and White) Macintosh Server G3 (Blue and White)	Ultra2 SCSI Card Firmware Update 1.2
iMac (Slot Loading) since early November 1999 and before Summer 2000	Ethernet Update 1.0
Power Mac G4, since late November 1999 and before Summer 2000	Ethernet Update 1.0

Note: You should install the Ethernet Update 2.0 on all computers using Mac OS 9.0 to 9.1. It also works with Mac OS 8.6.

If the Macintosh Management Server extension is installed, make sure that the latest version is installed and that you are using the latest version of the Macintosh Manager client software, as shown in the table below.

Software	Version
Macintosh Management Server for AppleShare IP	1.2.2
Macintosh Management Server for Mac OS X Server	1.2

- If you are using SoftRAID, make sure that the latest version is installed.
- If you are using Network Assistant, be sure that no Mac OS 9 computers have Network Assistant 3 installed on them.
  Note: Network Assistant 3 Admin does not work with Mac OS 9. Only Apple Network Assistant 4.0 or later works with Mac OS 9. Be sure to upgrade to the latest version available.
- If the recommended configurations and updates are not used, you may experience unexpected behavior.

Verify and Repair Server Volumes

Use Disk First Aid to verify and repair all server volumes.

Verify Cache Allocation

Verify that the AppleShare IP Cache allocation ("Maximum Server Memory") is set correctly. See technical document 106647: "**AppleShare IP 6.3.3: How to Verify Cache Allocation**"

Reconstruct Users & Groups Data File and the AppleShare PDS File(s)

Use the AppleShare IP First Aid utility to reconstruct the Users & Groups Data File and the AppleShare PDS file(s).

ASIP Thread Manager with Mac OS 9.0

If the server is running ASIP 6.3 and Mac OS 9.0, install the ASIP Thread Manager. This extension is not necessary for Mac OS 9.0.4 and 9.1 because its functionality was included in the Mac OS 9.0.4 system software update.

Sherlock Indexing

Turn off Sherlock Scheduled Indexing of all volumes on the server.

SNMP Extensions

Be sure the SNMP extensions are not installed on the server.

OT AutoPush Support Extension

Turn off the "OT AutoPush Support" extension.

Note: Doing this disables TCP filtering.

Retrospect Settings

If you are running Retrospect 4.0 or later, turn off 'System Heap Use' in Retrospect Preferences by following these steps:

1. Open Retrospect.
2. Click the Special tab.
3. Press and hold the Option key then click Preferences in the Special panel.
4. Select System from the list on the left side.
5. Deselect the checkbox labeled 'Use temporary system memory.'
6. Click OK.

SCSI Connections

Check all SCSI connections for proper cabling, termination, configuration, and updates. If the difficulties still persist, remove non-Apple peripherals such as SCSI tape drives, SCSI PCI cards, USB CD-ROM burners, and so on.

Extensions Manager

Follow these steps to turn on a set of standard extensions with which to operate the server:

1. Open the Extensions Manager and select the set of extensions named "AppleShare IP 6.3.x All".
2. Choose Duplicate Set from the File menu and make a duplicate. Use the duplicate set.
3. Disable the OT AutoPush Support extension.
4. Make sure the Open Transport SNMP extension is turned off.

Restart the computer and test again for the issue.

Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.
The following document can help you search for a particular vendor's address and phone number:
document 17159: "**Locating Vendor Information**"

Macintosh Manager 1.3: Mac OS 7.6.1 Panels Clients Stop Responding During Desktop Printing

Mac OS 7.6.1 Macintosh Manager 1.3 clients in the Panels environment may stop responding ("freeze") when printing to a desktop printer.
This article has been archived and is no longer updated by Apple.

Symptom

The client stops responding when printing to a desktop printer.

Solution

Update to Desktop Printing 2.1, which is a part of LaserWriter 8.6 and the Color StyleWriter 6000 driver package. It is available from **Apple Downloads**.

This issue only happens in Panels, so another workaround may be to use Restricted Finder, or to do the following:

1. Disable Desktop Print Monitor.
2. Disable the Desktop Printer Extension.
3. Disable the Desktop Printer Spooler.
4. Print to the selected printer in System Access using Macintosh Manager.

Published Date: Feb 18, 2012

Macintosh Manager 1.3: Users Exceed Quotas

Macintosh Manager 1.4 and later address an issue in which users can exceed disk quotas that are set in excess of 32 MB.
This article has been archived and is no longer updated by Apple.

Symptom

If the disk quota in Macintosh Manager is set to any value higher than 32767 K, users are not restricted from saving further data. If the quota is set to 32767 K or lower, the quota works as expected.

Solution

Update to Macintosh Manager 1.4 or later. Macintosh Manager 1.4.1 is available at Apple Software Downloads (http://www.apple.com/swupdates/).

HyperCard 2.0: Retooling the Limited Version

How can I access the stack-editing features of the HyperCard that came with my Macintosh?

This article has been archived and is no longer updated by Apple.
The version of HyperCard that ships with the new computers has been set to look like a limited-function version. However, with a couple of alterations, you can make this version run at its full potential. Try any of these three workarounds:

- Type "magic" in the message box the first time you use HyperCard 2.0. (This handler cuts the opaque button from the last card in the Home stack.)

- Go to the last card in the Home stack and cut the opaque button that hides the "set userlevel" buttons. Click the "5" button.

- ?Type "set userlevel to 5" in the message box, each time you use HyperCard 2.0.

Or, you can buy a copy of full-featured HyperCard 2.0, with manuals, from Claris.

Published Date: Feb 18, 2012

Macintosh Classic: Video Adjustment Screws

On the back of the Classic, there is a cover over several adjustment screws. What do these adjust?

This article has been archived and is no longer updated by Apple.
These adjustment screws are for video adjustments. You can adjust the horizontal and vertical size and shift, along with the brightness, cutoff, and focus.

Published Date: Feb 18, 2012

LaserWriter: Networking vs. Switch Box

Can a Macintosh II and a Macintosh Portable share the same LaserWriter IINT using a switch box? Or am I better off using AppleTalk?

This article has been archived and is no longer updated by Apple.
Because all three products you mention have networking capabilities built-in, there is no reason not to connect them together with LocalTalk. You can use a switch box, but it would not be easy, and it would be largely a waste of time.

LisaCalc: Updating Documents From Earlier Releases

This article has been archived and is no longer updated by Apple.

The new calculation algorithm in LisaCalc, release 3.0, may be unable to fully update a spreadsheet created with an earlier version of LisaCalc. If no data was included to calculate a value for a cell created using Paste Adjusting, then the formula may not be present in the updated spreadsheet. If this occurs, simply Paste Adjust the formula again.

Published Date: Feb 18, 2012

Macintosh: Power Supply Requires Grounding

I need Macintosh systems that work with 220VAC 50Hz with no ground.

This article has been archived and is no longer updated by Apple.
All members of the Macintosh SE and Macintosh II families have universal power supplies. They are all set to work from 100-240VAC 50/60Hz.

For safety reasons, Apple cannot recommend using a system with no ground. The equipment might work, but would not be safe to use. If a short were to occur, you would be keeping a circuit breaker from stopping the short by not using a ground.

Published Date: Feb 18, 2012

TA47377_Macintosh_IIci_Using_NonParity_SIMMs_(TIL09013).pdf

Macintosh IIci: Using Non-Parity SIMMs

If I put any non-parity SIMMs in a Macintosh IIci with parity checking, will parity checking still work?

This article has been archived and is no longer updated by Apple.

No. In order for parity checking to work, all SIMMs have to be parity checking also.

On the other hand, using parity SIMMs in a non-parity IIci shouldn't be a problem as long as all the SIMMs in a bank are the same speed.

Published Date: Feb 18, 2012

MacLAN Connect: How to Install It

Some users need to fuse Macintosh networks to OS/2 nets with Token Ring as unifying backbone. Primarily, Macintosh users create documents that need to be stored on the OS/2 servers and accessed from OS/2 workstations. To a lesser extent, the OS/2 stations share documents with Macintosh users.

This article has been archived and is no longer updated by Apple.
MacLAN Connect from Miramar Systems is a solution. MacLAN Connect enables any PC/XT/AT/386 or compatible to function as an AppleShare-compatible server. All hard disks, LAN volumes, or other storage devices are available to AppleShare-connected Macintosh workstations.

MacLAN Connect is AppleShare Phase 2 compliant. It supports EtherTalk, TokenTalk, Internet Routers, and so on. AppleTalk Filing Protocol (AFP) Version 1.1 specifications are fully supported.

Basically, MacLAN turns a DOS system into an AFP server (which appears to Macintosh systems as any other AppleShare server). In addition, if you log on to PC server volumes before running MacLAN, these volumes can be mounted as logical volumes on the MacLAN AFP servers. Therefore, PC LAN volumes and OS/2 volumes can mount on the Macintosh desktop as AFP volumes.

Although, the process of installation is complex, once installed, it works well. Here's an installation process that worked for one site:

Basic Network

Our basic network setup looks like this:

--Macs on PhoneNet-----
|
Mac IIx, OS/2 Model 50
with Token Ring card, V1.2 running
running router LAN Server MacLAN
| | |
----------MAU----------
(these are on 4Mb Token Ring)

Necessary Software

On the Model 50, you must install the IBM token-ring drivers, Apple token-ring drivers, and the DOS LAN Requester software. DLR is a separate software package that comes with LAN Server. You must install it on a workstation before the station can log on to the server. You also need the PC LAN Support disk to determine the address settings on the IBM Token Ring card. In short, you need:

- DXMAID disk from IBM for IBM Token Ring drivers.

- MacLAN Connect, for the AFP server software and the Apple drivers. Note: In several places in the documentation, you are told to use AppleShare PC as the source of the Apple drivers. This works if you only want to mount the MacLAN CPU's hard disk as an AFP server. This will not work if you want to attach PC LAN or OS/2 volumes as logical volumes, because the ASPC drivers trash the LAN Requester process. In addition, ANET is installed in the AUTOEXEC file by the ASPC installation, and this causes problems. If you follow the documentation here, it won't work.

Instead, use the drivers supplied with the MacLAN package. They're

based on the ASPC drivers. The TOKEN.COM file has been altered to permit the IBM code and Apple code to coexist better.

- IBM Support disk, to check addresses on Token Ring card.

- DOS LAN Requester installation disks (2 disk set)

- Because you want to see the PC server volume on your Macintosh desktop, you'll need to be a user on the PC server. Before beginning this installation, have the system administrator make you a user on the PC server volume. (Under OS/2, this need not mean an entire hard disk; you can designated individual directories as volumes. For our purposes, we designated one directory called COMMON as a shared volume on the OS/2 server.)

Installation Process

Here is the installation process:

1) Install the IBM Token Ring drivers with DXMAID. Check the Config.sys file. It should include:

Files=100
Buffers=50
DEVICE=DXMAOMOD.SYS 001
DEVICE=DXMCOMOD.SYS
DEVICE=DXMTOMOD.SYS

Adjust the files and buffers if your values don't match these. (Note: There is a complete CONFIG.SYS later in this article.)

2) Use the IBM Support Disk to find the ROM and Shared RAM address for the installed Token Ring card.

Typical addresses are:
ROM: DE000
Shared RAM: D8000

These addresses are very important -- you must edit your NET.CFG file later to adjust the MEM 1 and MEM 2 parameters to match these addresses. (If you've ever installed ASPC with Token Ring drivers, you get two screens asking you to set the "primary" and "secondary" memory addresses -- that's what these values are.)

3) Install the DOS LAN Requester software from the IBM disks included with OS/2 LAN Server.

During this process, a directory called DOSLAN is created, and it stores the LAN Requester files as they are unpacked. (Later these files are invoked by commands like "net start" to kick off the network link and "net logon user1" to log on to the server as user1.)

4) Create a directory on the DOS system called MACLAN.

5) Copy the file MACLAN.EXE from MacLAN Disk 1 to the directory and execute it. The file unpacks into the MacLAN executables, including MLCONFIG and MLSERVE.

6) From MacLAN Disk 2, execute the INSTALL.BAT file to install Apple drivers. This creates a DRIVERS directory that contains the appropriate code.

These files look like the usual ASPC code. After installation, check the AUTOEXEC file, and you'll see the familiar code for the ASPC driver installation. However, according to the MacLAN author, some of the

files have been altered, so they can work with LAN Requester.

7) Use a convenient editor to edit the NET.CFG file in the DRIVERS directory. This file will look like this:

```
Link Support
Buffers 11 640
MemPool 16K

Protocol AppleTalk
DEFAULT TOKEN$ #1
AARP TOKEN$ #1 H(0002) L(6) B(C00040000000)

Link Driver TOKEN$
# IBM Token-Ring Network Adapter/A (MicroChannel)
INT #1 2
MEM #1 DE000 0200
MEM #2 D8000 0400
PORT #1 A20 8
PORT #2 2F0 8
PS/2 Slot?
Protocol AppleTalk AA080007809B
Protocol AARP AA00000080F3
```

8) Here are the important pieces:

* Change Buffers and Mempool to these figures.

* INT specifies the interrupt for the card. 2 is OK for Mod 50.

* Remember those ROM and RAM addresses from the IBM Support disk? Set MEM 1 to the ROM address for the Token Ring card. Set MEM 2 to the shared RAM address for the card.

9) Do a warm reboot with Ctrl-Alt-Del. You should see messages indicating that the IBM drivers are loading, followed by the Apple drivers loading.

10) Run DOS LAN Requester and log on to the PC server. This establishes a logical connection between the MacLAN DOS CPU and the remote server volume. In this case, you have designated a directory called COMMON on the OS/2 server as logical volume X. Once you establish the connection, you can log on to the X volume and directory as usual.

11) Run MLCONFIG. This is the MacLAN configuration program, similar to AppleShare Admin program. You set up Macintosh users and groups as usual. The key piece is that you specify the volumes (including the logical attached volumes) that you want to appear as AFP volumes to Macintosh users. To specify the local Mod50 hard drive as an AFP volume, you specify the C drive. In this case, to specify the OS/2 directory that is mounted as the logical X drive, we specified the X drive and the C drive.

This is a nice feature; each volume can be assigned a volume password, in addition to the generic server password. Many people need the additional layer of security.

12) Run MLSERVE. (Be sure to run this from the MacLAN directory, or it can't find the files that it needs.) This kicks off the AFP server process.

When the AFP server is mounted, Macintosh systems on the LAN can see the MacLAN server from the Chooser. After logging onto the server, in our case the C drive and the logical X drive that we had mounted (which is actually a directory on the OS/2 server) appear in the Chooser volume list. After users log onto these volumes in the usual

Macintosh way, the volumes mount on the desktop and you're all set.

You can set up an AUTOEXEC file that automates this, but you'll have to do it manually the first time to set up MLCONFIG files.

Recommendation: MacLAN Connect is a bit harder than the typical Macintosh application to set up and configure, but once it's up and running, it's a seamless solution to this problem. The only real problems are on the OS/2 administrator's side, where they have to administer privileges, and the like, on their server. OS/2 is very much like UNIX in one way: it's very powerful, with lots of features and matching complexity.

The CONFIG.SYS File

This is final version of our CONFIG.SYS file. We adjusted Buffers and Files to MacLAN's recommended values.

```
DEVICE=C:\\DOS\\DXMA0MOD.SYS
DEVICE=C:\\DOS\\DXMC0MOD.SYS
DEVICE=C:\\DOS\\DXMT0MOD.SYS
SHELL=C:\\DOS\\COMMAND.COM /E:2000 /P
BUFFERS=60
FILES=100
FCBS=16,8
LASTDRIVE=Z
BREAK=ON
```

The NET.CFG File

This is final version of NET.CFG file in DRIVERS directory created by MacLAN driver installation. Adjust the Buffers and MemPool settings, if necessary. The crucial changes to make are in Link Driver TOKEN$. Change MEM#1 to match the ROM addresses of your Token Ring card and MEM #2 to match the shared RAM address of your card. You can find these by running the IBM Support disk for your system.

```
Link Support
Buffers 11 640
MemPool 16K

Protocol AppleTalk
DEFAULT TOKEN$ #1
AARP TOKEN$ #1 H(0002) L(6) B(C00040000000)

Link Driver TOKEN$
# IBM Token-Ring Network Adapter/A (MicroChannel)
INT #1 2
MEM #1 DE000 0200
MEM #2 D8000 0400
PORT #1 A20 8
PORT #2 2F0 8
PS/2 Slot?
Protocol AppleTalk AA080007809B
Protocol AARP AA00000080F3
```

The AUTOEXEC.BAT File

This is a copy of our final AUTOEXEC file. It loads Apple drivers, uses "net start" command, and "net logon test1" command to log on to OS/2 server volume as user test1 automatically and launch MacLAN AFP server with MLSERVE command.

```
echo off
C:\\drivers\\LSL
if errorlevel 1 goto aspc_err
C:\\drivers\\TOKNRING /NAME=TOKEN$
if errorlevel 1 goto aspc_err
C:\\drivers\\Atalk
if errorlevel 1 goto aspc_err
C:\\drivers\\compat
if errorlevel 1 goto aspc_err
C:\\drivers\\aarp
if errorlevel 1 goto aspc_err
REM *** Memory usage for the above programs is approximately 66K bytes.
goto skip_aspc
:aspc_err
echo *** A fatal error has occurred while loading AppleShare PC. ***
pause *ASPC*
:skip_aspc
@echo on
PATH=C:\\DOS;C:\\DOSLAN;C:\\DRIVERS;C:\\MACLAN;C:\\TOOLS;C:\\;
SET PMDIR=C:\\TOOLS REM**This is PathMinder directory--ignore
IF ERRORLEVEL 1 GOTO NODLR
NET START REM ** This kicks off network connection
IF ERRORLEVEL 1 GOTO NODLR
net logon test1 REM ** This logs onto specified server vol as test1
:NODLR
mlserve REM*** This kicks off the server
```

Macintosh 21" Color Display: Automatic Degaussing Feature

This article explains the circuitry in the Macintosh 21-inch Color Display that compensates for magnetic field image distortion.
This article has been archived and is no longer updated by Apple.
The circuitry in the Macintosh 21-inch Color Display provides what is called automatic degaussing to ensure a good image on the screen. Color displays use magnetic fields to guide electron beams inside the CRT to the screen. An external magnetic field close to the CRT can disturb the internal magnetic field, misdirect the beams, and distort the screen image.

Circuitry in most monitors adjusts the internal magnetic field to counteract the external magnetic field, but only at startup. If the external magnetic field changes during operation, a distorted image remains until the power cycles off and on. The AppleColor High-Resolution RGB Monitor has a manual degauss control button that you can press rather than turning off the monitor.

The Macintosh 21-inch Color Display has startup, manual, and automatic degaussing features. It contains an auto-degaussing circuit, called a magnetometer, that measures magnetic fields. The magnetometer sends a signal that initiates a degauss when it senses a major change in the ambient magnetic field. The magnetometer operates constantly while power is on, and degaussing can occur even when no image is on the screen.

Tilting or swiveling the monitor may change the magnetic field enough to cause distortion, and trigger automatic degaussing. Occasional automatic degaussing is normal. If degaussing occurs when you haven't moved the monitor, a source of interference may be in the room. You may have to move the source of interference to reduce the frequency of automatic degaussing. Frequent auto-degaussing can be annoying because it causes the screen to continually blink.

Macintosh 21" Color Display: Ergonomic Features

This article lists the ergonomic features of the Macintosh 21-inch Color Display.

This article has been archived and is no longer updated by Apple.
Important ergonomic features include:

- The antiglare, antistatic panel reduces glare and dust build-up.

- The built-in tilt and swivel base allows you to change the viewing angle.

- A 75 hertz screen refresh rate eliminates screen flickering.

- The ADB ports are easy to access on the front of the base.

- The brightness and contrast controls are also easily accessed on the front of the monitor.

- The following features minimize the desk space needed for the monitor:

- Curved and recessed base
- Recessed video cable connector
- Right-angled power cord

- The hard plastic spheres on the bottom of the base make it easier to lift and slide the monitor.

Macintosh 21" Color Display: Shadow Mask

This article explains the function of the shadow mask used in the Macintosh 21-inch Color Display.
This article has been archived and is no longer updated by Apple.
The Macintosh 21-inch Color Display uses a perforated shield called a shadow mask to separate the red, green, and blue electron beams that create the displayed images. Electron beams pass through a mask to strike the designated red, green, or blue dots of phosphor on the back of the screen. These beams cause the colored phosphor dots to glow. The combination of glowing dots produces the color images.

A metal mask or shield commonly used is a vertically-oriented aperture grill design. Traditional mask designs use perforations arranged in a pattern that interacts with the changing pattern of the electron beams as they scan across the shield. The interaction of these patterns frequently causes a screen interference called a moire pattern. The interference is more obvious with certain Macintosh desktop patterns.

The Macintosh 21-inch Color Display uses a pattern of tiny holes in the shadow mask that avoids the distracting effects of the most common moire patterns. This design is an asymmetric dot pitch of .026 mm horizontally and .029 mm vertically. Dot pitch is the distance between two adjacent RGB dot triads. To achieve a high resolution, dot pitch should be as small as possible. This pattern doesn't conflict with the pattern created by electron beams.

Macintosh 21" Color Display: Video Card Support

What video cards support the Macintosh 21-inch Color Display?

This article has been archived and is no longer updated by Apple.
The same video cards that support the Apple Two-Page Monochrome Monitor support the Macintosh 21-inch Color Display. Cards supporting the 21-inch Color Display include:

- Macintosh Display Card 4*8 at 4 bits per pixel

- Macintosh Display Card 8*24 at 8 bits per pixel

- Macintosh Display Card 8*24 GC at 8 bits per pixel

Here is a table of Macintosh computers and their requirements for use with the Macintosh 21-inch Color Display:

Macintosh	Requirements to Use 21-Inch Color Display
LC	Third-party video card
IIsi	Video card (note 1)
IIci	Video card (note 1)
IIfx	Video card (note 1)
Quadra 700	16 colors built in (notes 1,2)
Quadra 900	256 colors built in (note 2)

Notes (1): Add a third-party video card for 16.7 million colors.
(2): Add VRAM to the logic board for 32,000 colors.

Macintosh 21" Color Display: Adjustable Color Temp

This article explains the adjustable white point color temperature feature of the Macintosh 21-inch Color Display.
This article has been archived and is no longer updated by Apple.
The white point color temperature is a measure, in degrees Kelvin, of how white a display's white is. Traditional displays use a 9300 degree K white, which has a bluish tint to it and a high contrast. A 6500 degree Kelvin white is similar to page white and is more useful for color matching.

This feature is important to graphics professionals, although other users will appreciate having the choice. With it, users can more closely match the color of an object designed on a computer with how it looks when printed by a commercial printer. The page-white gamma table provides 6500 degrees K white point, which matches the color of white paper. This improves WYSIWYG in graphic design, since the white backgrounds of the monitor and paper are the same.

The Macintosh 21-inch Color Display allows adjustment of the white point color temperature. To make an adjustment, follow these steps:

1) Select the monitor CDEV in the Control Panel. (In System 7, open the Monitors control panel.)

2) Hold down the Option key and click on the Option button.

3) The options dialog offers a choice of gamma tables. Choose:
- the Mac Std Gamma option for 9300 degree K,
- the Page-White Gamma option for 6500 degree K white, or
- uncorrected gamma.

Apple Desktop Bus (ADB): Specifications (12/94)

This article provides specifications and information about the Apple Desktop Bus, which was introduced with the Apple IIGS and has been used in Macintosh computers since the introduction of the Macintosh SE and Macintosh II.

This article has been archived and is no longer updated by Apple.
The Apple Desktop Bus (ADB) is a standard for input devices connecting to the Apple IIGS and later Macintosh computers that follow the Apple Desktop Bus protocol. Because the Apple Desktop Bus is run by an intelligent microcontroller, a number of different types of input devices may be connected to the ADB simultaneously: the computer's keyboard, mouse, tablet, light pen, second keyboard, or joystick.

Each device has a unique bus address, so that the ADB microcontroller may direct its commands to a particular piece of equipment. The ADB specification supports up to a maximum of 16 unique devices, however it is suggested that only 3 devices be connected to each ADB bus in order to prevent signal degradation problems from appearing. On the Apple IIGS, the control function is performed by the M50740 Keyboard Microcontroller. It uses a superset of the 6502 instruction set, and contains 96 bytes of RAM and 3K bytes of ROM. The Macintosh may use one of several different implementations which are documented in the Guide to the Macintosh Family Hardware manual published by Addison Wesley.

When the microcontroller requests input from a device, it sends a signal to the input device to "talk". If no return input information action (key pressed, mouse movement, button clicked, etc.) has occurred, the microcontroller keeps waiting for the device to respond until a time-out occurs.

The host may also instruct a device to "listen" to data being sent on the bus from the host. All devices on the Apple Desktop Bus must include the intelligence to respond to both talk and listen commands.

The Apple Desktop Bus uses a 4-pin mini-DIN jack and a 4-wire cable, with serial interface signals. When appropriate, the input device will have two ADB jacks, so that devices may be daisy-chained from the host. The Apple Desktop Bus Mouse does not have a second connector, so it must be at the end of the chain.

SPECIFICATIONS:

- throughput: approximately 154 bytes per second
- cable length: maximum 5 meters
- cable capacitance: maximum 100 picofarads per meter

ADB devices may use the +5 volt power supplied by the bus, but must not draw more than 500 mA total for all devices.

The Apple Standard Keyboard draws a maximum of 100 mA, and the Apple Extended Keyboard draws a maximum of 85 mA.

All devices are connected in parallel, using the signal, power, and ground wires. Due to connector resistance and signal degradation, daisy-chaining more than three devices is not recommended.

MacTCP: Description

This article describes MacTCP software.
This article has been archived and is no longer updated by Apple.
For information on the current version of MacTCP, see the Tech Info Library articles, "TCP/IP Connection for Macintosh 2.0.4" and "MacTCP 2.0.4 to 2.0.6 Patch: Read Me, Release Notes."

With MacTCP software, developers can create Apple Macintosh applications for network environments that use the Transmission Control Protocol/Internet Protocol (TCP/IP) protocol suite.

TCP/IP is a set of standards widely used for networking heterogeneous systems. MacTCP implements the User Datagram Protocol (UDP), TCP, and IP protocols, and conforms to Internet RFCs and MIL-STDs. This conformity ensures interoperability with systems on the TCP/IP Internet.

MacTCP is co-resident with the AppleTalk protocols and runs over both Ethernet- and LocalTalk-compatible cable systems. You can install it on a Macintosh Plus or later model Macintosh computer. It is compatible with System Software version 6.0.5 (or later) or version 7.x.

Features

- TCP/IP protocol driver implementation

- Compatible with Macintosh Plus or later model Macintosh computers

- Concurrent TCP/IP and AppleTalk operation

- Both C and assembly-language interfaces

- Address configuration using the Control Panel interface

- Apple-supported driver

Benefits

- Provides a standard platform for developing TCP/IP applications and solutions.

- Supports multiple concurrent TCP/IP services.

- Lets third-party developers create applications that can run on a range of Macintosh computers.

- Preserves full access to AppleTalk services. For example, users can run MacTCP while printing to an Apple LaserWriter printer over LocalTalk cable.

- Provides developers with a familiar development environment.

- Simplifies installation and setup procedures for users and network administrators.

Published Date: Feb 18, 2012

MacTCP 1.x: System Requirements and Product Details

This article gives the system requirements for using MacTCP, and details about what MacTCP offers.
This article has been archived and is no longer updated by Apple.

System Requirements

LocalTalk-compatible systems

- A Macintosh Plus or later model Macintosh computer
- System software version 6.0.5 or later and at least 1MB of memory, or system software version 7.0 and at least 2MB of memory
- Appropriate LocalTalk-compatible cable connectors
- A router with AppleTalk and TCP/IP support, such as the Shiva Corporation FastPath 5 or the Cayman Systems GatorBox CS

Ethernet-compatible systems

- A Macintosh Plus or later model Macintosh computer
- System software version 6.0.5 or later and at least 1MB of memory, or system software version 7.0 and at least 2MB of memory
- An appropriate Ethernet interface card such as the Apple Ethernet NB Card

Product Details

MacTCP consists of object code libraries and associated files for both C and assembly-language development. Libraries include TCP and UDP interfaces along with a name-to-address resolver. A programmer's reference guide and an administrator's guide are provided.

The MacTCP driver allows for the addition of other data link layers through the use of a link layer interface between the IP layer and the data link layer of MacTCP. Examples of these data link layers include Token Ring (IEEE 802.5), Serial Line Internet Protocol (SLIP) -- RFC 1055, and Point- to-Point Protocol (PPP) -- RFCs 1171 and 1172. The link layer interface is described in the reference document Building Alternate Link Access Protocol Modules for MacTCP, available to Apple Partners and Apple Associates through the Developer CD Series.

Protocols

MacTCP implements the following protocols:

IP (RFCs 791,894;MIL-STD 1777)
UDP (RFC 768)
TCP (RFC 793, MIL-STD 1778)
ARP (RFC 826)
RARP (RFC 903)
ICMP (RFC 792)
BootP (RFCs 951, 1048)
RIP (IDEA004)
DNS (RFCs 1034, 1035)
Internet Subnetting (RFC 950)
Internet Assigned Numbers (RFC 1010)

MacTCP complies with Requirements for Internet Hosts-Communication Layers (RFC 1122)

Throughput is 3.0 megabits per second memory-to-memory (on a Macintosh II-family computer over Ethernet).
Published Date: Feb 18, 2012

MacX25: System Requirements and Product Details

This article gives the system requirements for using MacX25 as well as details about what MacX25 offers.
This article has been archived and is no longer updated by Apple.

System Requirements

- MacX25 Server

To set up a MacX25 server, you need:

- Any modular Macintosh computer with an internal hard disk and at least 2MB of memory for System software version 6.0.7 (4MB of memory for version 7.0)

- Macintosh System software version 6.0.7 (or later) or version 7.0

- An Apple Serial NB Card with the appropriate RS-232-C or V.35 cable

- The appropriate cable connectors

To use MacX25 on an Ethernet or a token ring network, you need the appropriate interface card for your Macintosh.

- MacPAD

To use MacPad, you need:

- A Macintosh Plus computer or later model with at least 1MB of memory for System software version 6.0.7 (2MB of memory for version 7.0)

- A terminal-service application that uses the Macintosh Communications Toolbox

- The appropriate cable connectors

To use MacPAD on an Ethernet or a token ring network, you need the appropriate interface card for your Macintosh.

Product Details

- General Features

MacX25 supports:

- CCITT 1980 Compatible Mode
- CCITT 1984 Compatible Mode
- Packet Assembler/Disassembler (X.3, X.28, and X.29)
- Operation as a DTE
- Operation as a DCE
- Virtual Circuits: 64 maximum
- A single link for each Apple Serial NB Card
- Multiple cards for each modular Macintosh
- Operation at up to 19.2 Kbps with RS-232-C
- Operation at up to 64 Kbps with V.35
- Multiple servers for each AppleTalk network system

MacX25 doesn't support:

- Permanent Virtual Circuits
- X.32 switched circuit operation

- Network Certification

MacX25 is certified for connection to Telenet, GEIS (GEISCO), and Tymnet networks; and in Europe, for Austria (DATEX-P), France (Transpac), Germany (DATEX-P), Italy (ITAPAC), the Netherlands (Datanet-1), Norway (DATAPAK), Sweden (DATAPAK), and Hong Kong (DATAPAK).

In addition, MacX25 can be used to connect to the public PSDN in Australia (Austpac), Canada (Datapac), Denmark (DATAPAK), and Switzerland (Telepac).

- MacX25 Programming Library

The MacX25 Programming Library allows developers to create software solutions that provide users with access to a packet-switched data network. It works in conjunction with the MacX25 server to provide X.25 services to application programs.

The library is a toolkit, or collection of C language routines, that offers a high-level program interface for applications. Routines are included for initiating and terminating contact with the MacX25 server, establishing and closing down a virtual circuit, passing data across an established circuit, and more. Technical support is available to Apple Partners and Associates.

PowerBook Fax/Data Modem and AppleFax

Will the new Macintosh PowerBook Fax/Data Modem support data communication and file transfer with the AppleFax Modem? If it does, at what baud rate?

This article has been archived and is no longer updated by Apple.
The Macintosh PowerBook Fax/Data Modem will not communicate with the old AppleFax Modem in standard data communication mode. The Macintosh PowerBook Fax/Data Modem is capable of sending facsimiles to the AppleFax Modem.

Page 92 of the "AppleFax Modem User's Guide" states the following:

"If you want, you can use a communications application as long as you're communicating with another AppleFax Modem. A communications application lets you transmit Macintosh files, type messages back and forth, and use the modem commands described in Appendix B."

The manual goes on to say (on page 92) what communications parameters the AppleFax Modem requires to successfully use a 9600-baud modem.

This means that the AppleFax Modem will allow you to transmit Macintosh files (text files, MacPaint files, PICT files, and so on) to another Macintosh at 9600 baud as long as both modems are AppleFax modems. It isn't necessary for both AppleFax Modems to use the same communication software as long they support the same transfer protocol.

The AppleFax Modem does support a subset of the Hayes "AT" command set. For more information on this, look in Appendix B, which starts on page 137.

LaserWriter IIg: AppleTalk Phase 2 on EtherTalk Network

When an Apple LaserWriter IIg is connected to an EtherTalk network, is it an AppleTalk Phase 2 or AppleTalk Phase 1 node? I suspect that it is an AppleTalk Phase 2 node. Does this mean that it won't work on an AppleTalk Phase 1 EtherTalk network? Can it be changed to AppleTalk Phase 1 somehow?

This article has been archived and is no longer updated by Apple.
The Apple LaserWriter IIg, when connected to an EtherTalk network, is an AppleTalk Phase 2 device only. There is no way to make it an AppleTalk Phase 1 device on an EtherTalk network.

To get the Apple LaserWriter IIg to work on an AppleTalk Phase 1 EtherTalk network, you need to set up an AppleTalk Phase 1/AppleTalk Phase 2 transition router on the EtherTalk network.

MousePaint: Saving Pictures To Disk

Is there a way to save pictures to a different disk using MousePaint?
This article has been archived and is no longer updated by Apple.
Drive 1 is the default drive in MousePaint. To save a picture to another disk, specify a new ProDOS pathname by selecting "save a picture in" from the File menu.

Then type the pathname of your new destination disk: for example, /NewDisk/MyPicture.
Published Date: Feb 18, 2012

Quadra 900: Support for 8-Bit Sound

Does the Quadra 900 support 16-bit sound?

This article has been archived and is no longer updated by Apple.
No. The Macintosh Quadra 900 supports 8-bit sound.

Sound in overview:

- Quadra 900 and 700 microphone inputs are monophonic.

- Quadra 900 external sound input takes in stereo sound and turns it into a single audio signal before recording by combining the two channels.

- Both Quadra models play stereo samples through Batman (an updated version of the Apple Sound Chip) if you have stereo samples from a third party. Otherwise everything comes out monophonic.

Note one exception: If you have an internal CD-ROM, stereo tracks "Play through" to the headphone output in stereo. If you record from an internal CD, it will be monophonic.

Published Date: Feb 18, 2012

AppleShare 3.0: Setting Up a Temporary Account

How can I set up a user (name and password) for temporary use?
This article has been archived and is no longer updated by Apple.
1) In the Server Preferences dialog box, set the number of days until the password expires.

2) Change the user's privileges so that he or she can't change the password.

The only drawback is that it forces all server clients to change their passwords. The added security may be worth it.

AppleShare Drop Box: Access for System 6 and 7 Clients

Article Change History

08/19/92 - REVIEWED
* For technical accuracy; edited.

If a System 7 user creates a drop box on an AppleShare server, a 6.0 user can't see it. Is there a fix?

This article has been archived and is no longer updated by Apple.
A System 7 user would not be able to see this folder either. The drop folder was created in an area where the user doesn't have access privileges. You must create a drop folder within a folder that the user can access. The folder itself cannot be the share point. Since a user can't "See Folders" on a drop folder, it makes sense that they would be unable to mount that folder as a share point.

Create a folder named "Drop Folders" with all privileges except "Make changes." Within that folder make your drop folder. That should solve the problem.

System 7: Opening System File 6.0.X from System 7

Article Change History

09/11/92 - REVIEWED
* For technical accuracy.

From my Macintosh running System 7, I opened a version 6.0.X System file to get a list of fonts, DAs, and sounds installed in that System file. With that window open, if I choose Page Setup or Print Window from the File menu, garbage is displayed on the right side of the menu bar in the Balloon Help and Application areas.

This article has been archived and is no longer updated by Apple.
Although you can open a version 6.0.X System file under System 7 to get a list of fonts, DAs, or sounds installed, don't choose Print Window or Page Setup for that window. When you open the System file on the version 6.0.X disk, System 7 tries to use the System resources from the version 6.0.X file -- the most recently opened resource file -- which causes unpredictable results, including displaying garbage in the menu bar.

Macintosh 21" Color Display: Shipping with CD-ROM

Why is Apple shipping a CD-ROM in the box with the Macintosh 21-inch Color Display?

This article has been archived and is no longer updated by Apple.
The CD-ROM is full of color images, color clip art, screen savers, and demo versions of the most popular color software applications. With this disc, you can experiment with the latest in full color software and immediately take advantage of the features of the new display.

TA47398_Macintosh_Color_Display_Pixel_Count_(TIL09037).pdf

Macintosh 21" Color Display: Pixel Count

How much bigger is the Macintosh 21-inch Color Display compared to the standard AppleColor High-Resolution RGB Monitor (the 13-inch RGB)?

This article has been archived and is no longer updated by Apple.

The Macintosh 21-inch Color Display offers a pixel area of 1152 x 870, over three times as much usable viewing area as the 13-inch High-Resolution RGB or VGA monitors, which have 640 x 480 pixels. In addition, the 21-inch Color Display offers 27 percent more screen area than 1024 x 768 monitors, such as 19-inch color displays and XGA-type monitors.

Published Date: Feb 18, 2012

Macintosh 21" Color Display: Color Calibrator Support

How much larget is the Macintosh 21-inch Color Display compared to the standard AppleColor High-Resolution RGB Monitor (the 13-inch RGB)?

This article has been archived and is no longer updated by Apple.

The Macintosh 21-inch Color Display offers a pixel area of 1152 x 870, over three times as much usable viewing area as the 13-inch High-Resolution RGB or VGA monitors, which have 640 x 480 pixels. LaserWriter IIf & IIg: PhotoGrade, FinePrint & Microfine Toner

1) Do the LaserWriter IIf and IIg use microfine toner?

2) Is FinePrint different from H-P's RET?

3) How does PhotoGrade compare to RET and microfine toner?

This article has been archived and is no longer updated by Apple.

1) The LaserWriter IIf and IIg don't use microfine toner, because they get excellent results using the same size toner as before.

2) While they function differently, FinePrint and RET are both designed to improve the quality of text and lines without affecting performance.

3) PhotoGrade is completely different from RET or microfine toner. RET smooths text and lines. It doesn't improve images. Microfine toner doesn't improve the resolution of images; it just has smaller average toner particles. Since a single 300-dpi dot uses a number of particles, smaller toner has minimal impact on print quality.

ProDOS: Filenames and directories

This article provides background information on files and directories. Refer to your ProDOS User's Manual for a more comprehensive discussion of these conventions.
This article has been archived and is no longer updated by Apple.
Filenames

While DOS 3.3 allows you to save a file with a file name that has a tilde for the first characater, ProDOS is much more strict:

--Only fifteen characters
--Only the letters A-Z, numbers 0-9, and a period
--Only a letter for the first character
--No control characters

Some acceptable filenames are:

PotatoSalad
SillyProgram
Biz.letter
Memo.1.April.84

Some unacceptable filenames are:

Potato Salad - can't have spaces
Ridiculousprogram - too long--greater than 15 characters
Emily'sPoem - apostrophes aren't legal characters
Memo: Bill - colons and spaces are illegal characters

If you forget these rules: for example, you leave a blank in the middle of a filename, your program beeps and the cursor won't budge until you type a character that is aceptable.

Directories

When a volume is first formatted, it gets a name and a directory. Anything you save on that volume is accessed through that directory. The directory is also a file, but it just tracks where other files on the disk are stored. You could say that a directory file is like an address book.

There comes a time -- especially with a mass storage disk -- when it's convienient to have a way of organizing your files so you find such things as financial forecasts without listing the contents of the entire disk.

Subdirectories allow you to group your files logically. A subdirectory is just like a directory except that it's subordinate to the directory.

In the directory for the disk, you can create a subdirectory with the name "Financial", and in this subdirectory you create the subdirectories with the names "Forecasts" or "Statements". This kind of arrangement is called a hierarchial file structure because files are organized into successive levels.

Macintosh 21" Color Display: Not Designed for PC or UNIX Workstations

Can the Macintosh 21-Inch Color Display work with PC compatibles or UNIX workstations?
This article has been archived and is no longer updated by Apple.
No. This display is designed and optimized to work only with the Macintosh. Apple designed the Macintosh hardware and software to take advantage of large screen size, multiple monitors, and millions of colors.

Windows and UNIX workstation displays offer pixel areas of 1024 x 768. This provides fewer than a million pixels, which won't display two full pages. The Macintosh 21-inch Color Display provides over a million pixels and offers 27% more viewing area than these displays.

The Macintosh graphics architecture is based on software, while the others (VGA, XGA, UNIX) are based on hardware specifications. This means that the Macintosh takes advantage of many different screen resolutions, while XGA is limited to 640 x 480 or 1024 x 768. The Macintosh architecture supports 24-bit color and multiple monitor configurations. The flexibility of the Macintosh software architecture makes 24-bit color, graphics acceleration, and pivoting displays available on the Macintosh platform.

Macintosh 21" Color Display: Shadow Mask Picture Tube)

Does the Macintosh 21-inch Color Display use a Trinitron picture tube?

This article has been archived and is no longer updated by Apple.

No, this display uses a shadow mask tube. Compared to the 19-inch Trinitron, the 21-inch color display has a larger screen area, exceptional overall and corner focus, brightness uniformity, and the absence of moire interference effects.

Published Date: Feb 18, 2012

LaserWriter IIf and IIg: PC Connection

Given the lack of a Centronics interface, how can I connect a LaserWriter IIf or IIg to an MS-DOS PC?

This article has been archived and is no longer updated by Apple.
For this class of product, Ethernet and SCSI interfaces are more important than Centronics. Centronics was omitted due to space constraints.

Here are two ways for PCs to connect to the printer:

- The LaserWriter IIf and IIg support fast serial communication (up to 57K baud) for direct connection.

- LocalTalk cards from third parties enable PCs to share a LaserWriter.

LaserWriter IIf and IIg: All Ports Active vs QMS ESP

Is Apple's "all ports active" the same as QMS's ESP?

This article has been archived and is no longer updated by Apple.

Both Apple's "all ports active" and ESP allow connecting the printer's different ports at the same time. ESP goes the extra step of guessing what language is spoken (PCL or PostScript) and switching to that mode. "All ports active" allows reliable job switching in software.

Published Date: Feb 18, 2012

TA47407_LaserWriter_IIf_and_IIg_CameraReady_Art_(TIL09046).pdf

LaserWriter IIf and IIg: Camera-Ready Art

Can prints from a LaserWriter IIf or IIg be copied or taken to offset press?

This article has been archived and is no longer updated by Apple.

As with a photograph or high-quality print, PhotoGrade and FinePrint can be copied or used as camera-ready art. The resulting quality depends on the quality of the copy devices and processes. We see some degradation of quality. The printers can be set so they offer inferior originals that are more reproducible.

Published Date: Feb 18, 2012

LaserWriter IIf and IIg: How They Differ

What is the difference between the LaserWriter IIf and IIg?

This article has been archived and is no longer updated by Apple.
Both are based on the same design, but there are four major differences:

- The IIg has 5MB of RAM, which is the minimum required for PhotoGrade printing. The IIf can support PhotoGrade with the addition of a 4MB RAM Upgrade kit.

- Ethernet is built into the IIg. It is not available on the IIf.

- The processor on the IIg runs at 25Mhz compared to 20Mhz for the IIf.

- The IIf is less expensive.

LaserWriter IIf & IIg: How FinePrint and TrueType Enhance Output

1) Does FinePrint enhance text only, or graphics too?

2) What is the difference between TrueType and FinePrint?

3) Do the LaserWriter IIf and IIg sense differences between text and images?

This article has been archived and is no longer updated by Apple.

1) FinePrint smooths all black and white objects including:

* Text

* Line graphics

* Line-art scan

2) TrueType (or any outline font technology) scales text to look good at the printer resolution. FinePrint takes that high-quality 300-dpi text, and improves the quality further by eliminating the 300-dpi jaggies.

3) The printer differentiates between text and images, so that FinePrint smoothing is not performed on images. Smoothing images actually degrades the quality so it is critical to differentiate between these data types.

ProDOS: Pathnames and Prefixes

This article discusses ProDOS pathnames and prefixes.
This article has been archived and is no longer updated by Apple.

Pathnames

A pathname is the volume directory name, followed by any number of subdirectory names, followed by the filename. The entire pathname is preceded by a slash; furthermore, each name within the pathname is separated by a slash. This slash is called a delimiter.

To get to a particular file, ProDOS looks at the pathname for the volume directory name. ProDOS then finds that volume and looks in the volume directory for the location of the next subdirectory in the pathname. ProDOS then looks in that directory for the location of the file. You can have as many subdirecories as you want as long as the total number of characters in the pathname dosen't exceed 64.

Prefixes

You may not want to type a complete pathname every time you want to locate a file. ProDOS can store a partial pathname, called a prefix. This prefix stores care of as many subdirectories as you wish; you only type the rest of the pathname, such as the filename. ProDOS appends this after the prefix, completing the pathname, and then looks for the file you want.

To set a prefix with the ProDOS User's Disk:
1) boot from this diskette,
2) enter the filer
3) select P from the filer menu
4) enter your refix, the first character of which should be a slash.

When a you want a file and you want to use the prefix you've entered, don't type a slash for the first character, just type the rest of the pathname, e.g. the filename.

When you want a file and you want ProDOS to ignore the prefix you've entered, type a slash for the first character. This does mean, however, you have to type in the complete pathname, starting with the volume name.

TA47416_LaserWriter_IIf_and_IIg_No_Support_for_Kanji_(TIL09054).pdf

LaserWriter IIf and IIg: No Support for Kanji

Article Change History:

09/24/92 - REVIEWED
* For technical accuracy.
09/25/92 - UDATED
* To clarify PostScript Kanji support.

Do the LaserWriter IIf and IIg support Kanji?

This article has been archived and is no longer updated by Apple.
No. The LaserWriter IIf and IIg support Level-2 Post Scropt fonts.
Currently no Japanese Level-2 Post Srcipt fonts exist.

Published Date: Feb 18, 2012

SNAps Gateway and 3270: File Transfer and Printer Support

I just installed a TokenTalk card and the SNA*ps gateway and 3270 applications in a Macintosh IIsi. It's connecting to a mainframe through an OS/2 LanServer. We want to do file transfer and make use of printers on the system. Does SNA*ps support these needs?

This article has been archived and is no longer updated by Apple.
SNA*ps 1.0 supports IND$FILE transfer to TSO, CMS, and CICS. The manual documents this. There is no file transfer to the LANServer, only through the IBM host.

Published Date: Feb 18, 2012

LaserWriter IIf and IIg: No Automatic Emulation Switching

Does the LaserWriter IIf have auto-sensing for print emulation? The QMS 410 automatically senses HP PCL emulation, and switches the printer into HP PCL emulation mode following a Postscript print job. Does the LaserWriter IIf do this as well?

This article has been archived and is no longer updated by Apple.
The LaserWriter IIf and IIg do NOT automatically sense, and change, emulation modes. The QMS 410 provides auto-sensing for print emulation. In other words, when you send it a print job, it determines what kind of job it is and switched the printer into that mode. If you send it a PostScript job it switches into PostScript mode. If you send it an HP PCL job it switches into that mode.

The LaserWriter IIf and IIg do not do this. You set their ports up ahead of time and whatever they are set up for it what they will accept. The trick thing the LaserWriter IIf and IIg do is let you have more than one connection to the printer (2 for the LaserWriter IIf, 3 for the LaserWriter IIg). Each connection can be a different type of job. The only way to change emulations is via a PostScript program or switch setting.

There is a big difference between auto-sensing and arbitration.

Published Date: Feb 18, 2012

LaserWriter IIf and IIg: HP PCL 4+ Emulation

Does the LaserWriter IIf emulate HP PCL 4 or 5?

This article has been archived and is no longer updated by Apple.
The LaserWriter IIf and IIg have HP PCL 4+ emulation, which is equivalent to the LaserJet IIP.

Published Date: Feb 18, 2012

TA47420_Apple_OneScanner_Image_Quality_and_dpi_Ratings_(TIL09058).pdf

Apple OneScanner: Image Quality and dpi Ratings

How does the Apple OneScanner's 300 dpi compare to the 600 or 800 dpi claimed by other vendors?

This article has been archived and is no longer updated by Apple.
When other vendors claim 600 dpi or higher, they are usually referring to a combination of hardware (the true resolution of the scanner itself) and software interpolation. The OneScanner's hardware resolution is 300 dpi, which is more than adequate for the majority of common scanning, even for high-end printers such as imagesetters.

As for software interpolation, the Ofoto software allows scaling up to 16,000 dpi, which is much higher than anything commonly used. What matters is the quality of the resulting image, processed by both hardware and software.

TA47423_Apple_OneScanner_Image_Editing_Software_(TIL09060).pdf

Apple OneScanner: Image Editing Software

Why doesn't the Apple OneScanner ship with image editing software, such as Photoshop or ColorStudio, as do most other scanners?

This article has been archived and is no longer updated by Apple.
Image editing software isn't necessary for mainstream scanning. Other vendors require a multitude of image editing tools to adjust a scanned image to match the original, whereas Ofoto software automatically produces an accurate scanned image.

Image editing programs actually complement the OneScanner. Customers can benefit from those programs, but they aren't necessary for the basic purpose of getting an excellent scanned image.

SNAps 3270: System Requirements and Product Details

This article provides product details on the SNA*ps 3270 application software, and system requirements for using SNA*ps 3270.

This article has been archived and is no longer updated by Apple.

System Requirements

To use SNA*ps 3270 for CUT or 5-session DFT, you need:

- A Macintosh II system

- An Apple Coax/Twinax Card, Apple TokenTalk NB Card, or Apple Serial NB Card

- Macintosh system software version 6.0.5 or later

To use SNA*ps 3270 as a client to an SNA*ps Gateway, you need:

- SNA*ps 3270 or SNA*ps 3270 GC

- A Macintosh Plus or later Macintosh system as the client computer

- A Macintosh II system running the SNA*ps Gateway software on your AppleTalk network

- Macintosh system software version 6.0.5 or later

On the IBM host, you must have the following IBM file transfer software:

- 5665-311 (3270-PC File Transfer Program for MVS)

- 5664-281 (3270-PC File Transfer Program for VM/SP)

- 5798-DQH (CICS/VS 3270-PC File Transfer Program)

Product Details

- 3270 Terminal Emulation

SNA*ps supports the following terminal types:

- 3178/3278 models 1, 2, 3, 4, 5, and C3

- 3278/3279 models 2, 3, 4, 5/S2A, S2B, S3A, and S3B

- 3180 model 1

- 3191/3192 Display Station models A, B, C, D, E, F, and L

- 3270 Display Terminal Functions

SNA*ps 3270 supports base and extended attributes, extended color support, and OIA status line symbols.

- MultiFinder Compatibility

SNA*ps 3270 stays active in the background under MultiFinder, enabling file transfers to continue while you work with other 3270 sessions or local Macintosh applications.

- AppleTalk Gateway

SNA*ps 3270 runs as a client to a SNA*ps Gateway on the user's computer or on another computer connected to the AppleTalk network or internetwork.

- Special Features

SNA*ps 3270 includes on-line help, keyboard remapping of 3270 control keys, on-screen keypads for easy access to frequently used 3270 keys, and keystroke recording and playback for automating operations such as file transfers and electronic mail retrieval.

PowerBook Wins Usability Study (7/92)

Apple's new Macintosh PowerBook notebook computers scored highest in a usability study conducted by an independent industrial design firm. The PowerBook models 170 and 100 won over eight competitive notebooks from Compaq, Toshiba, NEC, Sharp, Zenith, IBM, AT&T, and Zeos. The study involved more than 450 tests of design, ergonomics, functionality, portability, and ease of use.

This article has been archived and is no longer updated by Apple.

A New Approach

Most notebook computer reviews deal with "speeds and feeds," an approach more for technologists than for end users. Apple hired GVO, an independent design company not involved in any of the systems tested, to put the leading notebook computers through a series of real world usability tests, to quantify their designed-in advantages. They performed tests across the whole spectrum of notebook use: from the time the user first opens the box, through extended use in the office and in the field (including use in airplanes and cars).

The NCAT (Notebook Computer Aptitude Test)

GVO specialists evaluated the machines according to four key criteria:

- Function/Purpose: How well the product fulfills the user's purpose
- Physical Fit: How well the product meets the user's ergonomic needs
- Learning/Understanding: How easy the product is to learn and understand
- Satisfaction: How satisfying the product is to see and to use

The study applied these values to out-of-the-box experience, installation and set-up, mechanics, initial use, long-term use, and use while travelling. In all, they conducted more than 450 individual design and usability tests, including true size and weight of all necessary components, set-up and tear-down effort for movement, desktop and laptop footprint, briefcase fit, ergonomics, balance, fit & finish, durability, image, power management, screen viewing angle and visibility, typing, GUI navigation, and usability in the office, on an airplane and in a car. They graded individual tests on a scale of 0 to 4 (4 being the best), and averaged the grades to compute a final score, giving all tests equal weight.

The Results

The Macintosh PowerBooks ranked the highest. The overall scores on a scale of 0 to 4 (4 being the best) were:

Macintosh PowerBook 170: 3.07
Macintosh PowerBook 100: 2.93
AT&T Safari: 2.65
Zeos 386SX: 2.35
NEC Ultralite 286F: 2.29
Toshiba T-2000SX: 2.28
Zenith MasterSport 386SX: 2.22
Compaq 386S/20: 2.15
Sharp 6641: 2.02
IBM PS/2 L-40: 2.00

The PowerBook 140 wasn't included in the test due to its similarity to the PowerBook 170.

The DOS-based systems were equipped with Windows 3.0 and a Logitech TrackMan Portable track ball, in order to compare graphical environments.

Some Quotes From The Findings

"The PowerBook 170 and 100 represent the best notebook value available in the market today.

"The PowerBooks are easily the most portable and flexible of the 10 notebooks tested."

"Through a clever integration of engineering, design, and ergonomics, Apple has created the first notebook computers that can actually be used comfortably in someone's lap."

"The combination of small size, low weight, elegant design, integrated trackball, palm rests, active matrix LCD, and software-controlled floppy drive makes the PowerBook 170 the most usable, versatile, and desirable system tested."

Putting The Tests In Perspective

The Ingram benchmark study showed that the PowerBooks deliver faster performance than competitive notebooks running Windows 3.0. The NCAT gives evidence that the PowerBooks are more usable than the competition. And the DRI studies show what that means to users -- they say they are more productive and satisfied than people who use PC clones running DOS or Windows 3.0.

About GVO

GVO is an independent industrial design firm, located in Palo Alto, California. It was not involved in the design of any of the machines tested. GVO has designed other notebook computers, and is experienced in human engineering, electronics packaging, product planning, and cognitive psychology.

NOTE: If the NCAT results are to be used in a public document, our contract with GVO requires Competitive Analysis to review it first. Please send your drafts to COMPETITION.

Macintosh Quadra 700 and 900: Recording 44kHz Sound

Is it possible to record 16-bit and 44kHz CD quality on a Quadra 700 or 900?

This article has been archived and is no longer updated by Apple.
The Quadra's sound input is 8-bit linear PCM with analog limiting to enhance the power of the signal being digitized. The sample rate may be 22kHz or 11kHz. Therefore, to achieve 44kHz input, you'll need to obtain third-party hardware and software tools, such as those from Digidesigns, Inc. Information on Digidesigns' offerings may be found in buyer's guides, including the electronic buyer's guides on AppleLink.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Apple IIGS: Network Slot Assignments

You can often trace Apple IIGS network printing difficulties to the setting of slot assignments in the Control Panel.

This article has been archived and is no longer updated by Apple.

Setting Correct Network Slot Assignments

Here are the steps to set the proper network slot assignments:

1) Find the Apple IIGS ROM versions in the initial splash screen when you start the computer. The bottom line of that screen contains information noting either 01 or 03 version ROMs.

2) Open either the Apple IIGS Control Panel (Open Apple-Control-Escape) or the Graphic Control Panel (under the Apple Menu in the GS/OS menu bar).

3) Here are the correct slot settings:

* For Apple IIGS systems with version 01 ROMs, set Slot 1 to "Your Card" and Slot 7 to "Built-in AppleTalk."

* For Apple IIGS systems with version 03 ROMs, set Slot 1 or Slot 2 to "AppleTalk" and Slot 7 to "AppleTalk."

ProDOS 8 Applications

Some ProDOS 8 applications require printer slot definition. In such applications, you need to select the appropriate slot within the application's printer selection routine. For ROM 01 the appropriate slot for network printing will be slot 7. For ROM 03 the appropriate slot for network printing will be slot 1.

Other ProDOS 8 applications insulate the user from the need to select a specific slot. For example AppleWorks 3.0N uses a printer called "ImageWriter (AppleTalk)." The user often still needs to select a printer from within the application. However, these applications indicate that a printer is a network printer.

GS/OS Applications

Applications that are GS/OS based (those that display the Graphic Control Panel) use the Control Panel (or the AppleShare Admin startup information) to select their printer. You don't need to set printer slot assignments within the application. They are handled by the operating system from the Control Panel settings (or the AppleShare Admin startup information).

Macintosh LC: Print, Copy, or Save Apple IIe Card Screen

How can I dump the screen of the Macintosh LC to an ImageWriter connected to the Modem Port while using the Apple IIe Card in Apple IIe mode? Cmd-Shift-4 reportedly doesn't work as it does under the Macintosh operating system.

This article has been archived and is no longer updated by Apple.

Screen Dump to Printer

The following procedure works with version 2.0 of the Apple IIe Card software:

1) After launching the Apple IIe Startup application, open the Apple IIe Option Panel with Open Apple-Control-Escape (or Command-Control-Escape, for Macintosh users).

From the File menu, three options associated with the Apple IIe screen are available:

* Show Apple IIe Screen
* Save Apple IIe Screen╔
* Print Apple IIe Screen╔

From the Edit menu there is one option that is associated with the Apple IIe screen:

* Copy Apple IIe Screen

2) In the Apple IIe Option Panel, select the Slots icon in the left side scrolling window. Place the Printer Card icon in an appropriate slot (generally Slot 1).

NOTE: The icon labeled Serial Card with a plain printer icon is not the correct icon. The correct icon is labeled Printer Card. This icon has more printer detail.

3) Select the Printer Card icon in the left side scrolling window of the Option Panel. Then select the Chooser from the Apple menu. Choose the ImageWriter icon and select the Modem icon for the printer port. Close the Chooser.

4) To confirm the desired display of the Apple IIe screen, select the Show Apple IIe Screen item from the File menu. A reduced view of the Apple IIe screen displays in a Macintosh window. If the Apple IIe screen is 40 columns wide, the reduced view is readable. If the screen is 80 columns wide, the view is abstracted.

5) To print the Apple IIe screen, select the File menu item "Print Apple IIe Screen╔." This brings up the Macintosh ImageWriter dialog. Click OK to print the Apple IIe screen to the ImageWriter.

Save Screen to Disk or Clipboard

In a similar manner, you can save the Apple IIe screen to a MacPaint file by selecting "Save II Screen╔" from the File menu. Or you can copy the Apple IIe screen to the Macintosh Clipboard by selecting "Copy Apple IIe Screen" from the Edit menu.

Pressing Command-Shift-3 also saves the current screen to disk as a PICT file. Once you've saved the file, you can open MacPaint or any other paint program to print the PICT file.

Macintosh Monitors: Screen Size and Page Rulers Compared (10/95)

When I run my word processing program on different size Macintosh monitors, the program displays the same ruler width.

Why does the 12-inch RGB monitor display the same ruler width as the 9-inch monitor?

This article has been archived and is no longer updated by Apple.
Page rulers on a Macintosh monitor is determined by the number of pixels available, not by the physical screen size. The Macintosh Classic (and other compact Macintosh 9-inch screens) and the 12-inch RGB monitor are 512 pixels wide, so they display the same ruler length.

Even though the ruler width of the two monitors is the same, the 9-inch monitor is 342 pixels tall, while the 12-inch RGB monitor is 384 pixels tall. The 13-inch RGB monitor and the 12-inch monochrome monitor are 640 pixels wide and 480 pixels tall.

Ofoto 2: Improved Copy and Paste Function

This article compares the RAM requirements for copy and paste in Ofoto versions 1 and 2.
This article has been archived and is no longer updated by Apple.
The cut, copy, and paste functions of Ofoto 1 versions weren't optimized for working with other applications. For example, if you scanned a 4 x 5 inch, 300dpi gray scale image, and selected and copied it while in Ofoto, it was difficult to exit Ofoto and enter another application to paste the image. You would frequently see the error "Not enough memory to export this Clipboard" with Ofoto 1 versions. This operation required large amounts of RAM and disk space.

Ofoto 2 completely redesigned the cut, copy, and paste code. It is now possible to copy large, full color (as well as gray scale) images in Ofoto and move to another program to paste them in. It no longer requires large amounts of RAM and disk space.

On a related issue, the 2048K suggested partition size for Ofoto is a good beginning. However, a larger partition improves performance for all functions of Ofoto, not just for copy and paste.

LaserWriter IINT, IINTX, and Personal LaserWriter NT: Font IDs

I need the Adobe library numbers of the fonts in the ROMs of the LaserWriter IINT, IINTX, and Personal LaserWriter NT. I will buy additional fonts, but don't want to duplicate those already in the LaserWriter.

This article has been archived and is no longer updated by Apple.
The Helvetica, Times, Symbol and Courier included with the LaserWriter printers mentioned don't have numbers; they are available only with ATM. ATM users are probably the only ones who would ever want a PostScript version of the font, since ATM uses the PostScript font to create the on-screen representation.

Here are the font library numbers for the others:

Font Number	Font
1	Palatino
2	ITC Bookman
3	ITC Zapf Chancery
	ITC Zapf Dingbats
4	ITC Avant Garde Gothic
5	New Century Schoolbook

None of the font libraries has Helvetica Narrow.

Apple Remote Access: Multiple Clients

Can AppleTalk Remote be run on a Macintosh II computer that accepts several inputs from various modems, maybe with some NuBus boards?
This article has been archived and is no longer updated by Apple.
The 1.x version of AppleTalk Remote Access was not designed for this capability, and we don't know of any way of modifying it for this purpose.

The Apple Remote Access 2.0.1 Multi Port Server will allow multiple clients to log in however. Search the Tech Info Library on the Multi Port Server for additional information on that product.
Published Date: Feb 18, 2012

AppleTalk Remote Access: Setting Up Security Zones

I have these questions about setting up a security zone:

1) Can I change any part of the name? For instance, change the first 3 letters to conform with our naming convention.

2) If two or more security zones are introduced to the network, do I have to type multiple passwords? If I have one password, will it work for the entire network? Is it possible for two security zones to be on the network?

3) If I create a security zone with a password to set up the network properly, and the zone goes away, does the password continue to work? If a second zone is then introduced, will it continue to function or will I need a new password?
This article has been archived and is no longer updated by Apple.
1) No part of the SecurityZone name can deviate from that produced by the Security Stack. There are three characters that could be used before the 32-character zone name limit is exceeded, but then the AppleTalk Remote Access stations won't recognize it as a security zone.

2) You can have up to 16 security zones on a network. Each must have a different password (implied due to zone naming rules), and a user setting up a server need only know one of them. The software will search the entire zone list for a security zone with a matching password. This allows the administrator to group authorized servers and enable or disable groups as needed.

3) Just to clarify, a security zone will affect any AppleTalk Remote Access station on the same AppleTalk network, be it a LAN or WAN. The entire zone list is searched, and if a security zone is present, a password will be required. This is checked both at the time the answering station is set up, and during each connection attempt.

If you set up the answering station while disconnected from the network, the software wouldn't see the zone, and wouldn't ask for the password. But once you reconnected, and a remote user dialed in, the software would see the security zone and disable remote access. The same would happen if the security zone were set up after a station was set up to answer calls.

Also, there is a potentially annoying problem with the Security Stack used to generate the DES encrypted zone name. The field used to display the password is a couple of pixels too narrow and truncates the last character of the encrypted password. If you create a zone with this errant zone name, none of the answering stations will recognize it as a security zone.

The way to fix this is to widen the field slightly so the final character is visible. Use the HyperCard field tool (in authoring mode) to stretch the field bounds as needed, or enter the following command from the message window. It will correct the Zone field width to show the entire zone name.

set width of cd fld "Zone" to 236

Lisa: Error Tones

This article has been archived and is no longer updated by Apple.
Some systems (usually those containing old ROMs) emit a low-high error tone upon startup before starting the internal diagnostics. To proceed, merely power the Lisa off and back on.

Other errors, ones usually associated with hardware failures, sometimes appear on Lisas in the 7/7 Office System. Typically, you may have neglected to erase your hard disk before installing the 7/7 Office System. After you safely backup your documents, reinstall the software after first erasing the present contents of the hard disk.

SUM: Don‘t Install on a Server

I've received these two similar problem reports:

1) I have the SUM Shield INIT installed on my Macintosh. When I try to trash a file or folder while file sharing with another Macintosh, my system freezes.

2) I have the SUM Shield INIT installed on my server. Whenever I try to trash anything on the server from a Macintosh on the network, I get an error message saying that the item could not be found.

This article has been archived and is no longer updated by Apple.
According to Symantec, the solution is to not install SUM on a server. This problem happens when both the client and the server have the SUM Shield INIT in their System Folders. The SUM software is not intended for use on a server.

On AppleLink, you can find contact information on Symantec by clicking the "Library Index" button in the lower-center of the Tech Info Library search window, then opening the "Third Party Company Directory" folder.

System 7: How to Avoid PrintMonitor Corruption

Article Change History

09/21/92 - UPDATED
* To provide information about System 7 Tune-Up and LaserWriter driver version 7.1.1.

This article lists several steps to follow to help you avoid PrintMonitor corruption.

This article has been archived and is no longer updated by Apple.
The primary reason for corruption of the System 7 PrintMonitor is the LaserWriter driver version 7.0. The best way to avoid problems with PrintMonitor in the future is to install System 7 Tune-Up, which contains version 7.1.1 of the LaserWriter driver (or a version of system software greater than 7.01).

If you have not obtained and installed System 7 Tune-Up yet, or you think your PrintMonitor may be corrupted despite Tune-Up, follow the steps below.

1) Remove any jobs that are printing or are waiting to be printed from the PrintMonitor Documents folder.

2) Reinstall the Printing software.

3) Launch PrintMonitor and from the File menu select Preferences.

4) Configure PrintMonitor to display its window when printing by clicking the Yes button for that item.

5) Click the PrintMonitor application, and from the File menu select Get Info.

6) Increase the amount of memory allocated to PrintMonitor by increasing the amount of RAM shown for the Current size item of the Memory box in the Get Info window. We suggest doubling the 80K default allocation if you have that amount of memory available. Remember, this new amount of RAM needs to be available for background printing to start.

7) Lock the Get Info window by clicking the Locked box and close the window.

8) Create a new folder in the root level of your hard disk called PrintMonitor Backup. Option-drag a copy of the newly configured PrintMonitor to the PrintMonitor Backup folder.

9) Ensure that Background Printing is selected in the Chooser and restart your Macintosh.

Notes

- DO NOT quit the PrintMonitor application when a job is printing (with System 7 Tune-Up and LaserWriter 7.1.1 this is no long a problem).

- If you suspect your PrintMonitor application has become corrupted:

1) Trash your original version of PrintMonitor. (Remember to unlock it via the Get Info window first.)
2) Option-drag a copy of the uncorrupted PrintMonitor application from the PrintMonitor Backup folder to the Extensions

folder.

LaserWriter II: New Toner Cartridge Characteristics

I've heard that Apple has been shipping a toner cartridge with new toner for the LaserWriter II for some time. How is this toner cartridge different from the former toner cartridge? Is there a new or updated Safety Data Sheet for this toner?

This article has been archived and is no longer updated by Apple.
Several months before the introduction of the Apple LaserWriter IIg and LaserWriter IIf, Apple started shipping a new toner cartridge for the LaserWriter II family of printers. This new toner cartridge has an improved mechanism that provides more consistent feeding of toner to the paper. This is only noticeable when printing gray scale on the Apple LaserWriter IIg and LaserWriter IIf. There was also a change in the cartridge that helps prevent toner leaks.

Any toner cartridges that you find in stores today will be of the new variety. Externally, there is no way to tell the old cartridge from the new one.

There is no change to the Materials Safety Data Sheet.

Published Date: Feb 18, 2012

Quadra Series, Centris Series: Displays, Video Pinouts

This article details how to wire the video connector sense pins to access all the supported video modes of the Macintosh Quadra series and the Macintosh Centris series.
This article has been archived and is no longer updated by Apple.
The Macintosh Centris and Quadra frame buffer determines what type of display is attached to the video connector by examining the state of 3 sense line pins. The following chart details how these three pins must be wired for each of the supported display types. For each supported display, the screen resolution (horiz. pixels X vertical pixels), bandwidth, and the vertical and horizontal scan rates are listed.

The Macintosh Quadra series and the Macintosh Centris series should support any display, whether from Apple or from another vendor, that meets one of the following specifications:

STANDARD SENSE CODES:

Display	Sense pins 10 7 4	Hor x Vert (Pixels)	Band Width (MHz)	Vert Refrsh (Hz)	Horiz Refrsh (KHz)
Apple 21 Color	0 0 0	1152 x 870	100	75	68.7
Apple Portrait	0 0 1	640 x 870	57.2832	75	68.9
12" AppleColor RGB	0 1 0	512 x 384	15.6672	60.15	24.48
Apple 2-Page Mono.	0 1 1	1152 x 870	100	75	68.7
NTSC	1 0 0	underscan 512 x 384	12.2727	59.94	15.7
	1 0 0	overscan 640 x 480	12.2727	59.94	15.7
To produce a color NTSC signal, a RGB-to-NTSC converter is required.					
12" Apple High-Res Monochrome	1 1 0	640 x 480	30.24	66.7	35.0
13" AppleColor High-Res RGB	1 1 0	640 x 480	30.24	66.7	35.0
Apple 16" Color Disp.	(See Note 4)	832 x 624	57.63	75	49.7
Portrait Color, such as Radius	1 0 1	640 x 870	57.2832	75	68.9

NOTES:

1. Sense pins 4, 7, and 10 are referred to as MON.ID1, MON.ID2, and MON.ID3 in the Macintosh Quadra pinout table or SENSE0, SENSE1, and SENSE2 in pinout tables for the video connectors.

A sense pin value of 0 means that pin should be grounded to the C&VSYNC.GND signal; a value of 1 means do not connect the pin.

2. Extended sense codes will be examined if the following sense code is detected: 1 1 1.

3. The terms 'underscan' and 'overscan' are used to describe the active video resolution for NTSC and PAL modes. Underscan means that the active video area appears in a rectangle centered on the screen with a black surrounding area. This ensures that the entire active video area always is displayed on all monitors. Overscan utilizes the entire possible video area for NTSC or PAL. However, most monitors or televisions will cause some of this video to be lost beyond the edges of the display, so the entire image will not be seen.

4) The Apple 16" Color Display should have pins 4 and 10 tied together and pin 7 should be unconnected. If used with a Macintosh Display Card, the Apple 16" Color Display also requires the Macintosh Display Card 4*8, 8*24, or 8*24 GC with revised ROMs.

EXTENDED SENSE CODES:

NOTE: For extended sense codes: Sense pin pair value of 0 means those pins should be tied together (as opposed to grounding 10, 7, or 4 to pin 11); value of 1, do not connect. DON'T wire any of these pins to ground.

Display	Sense pins 4-10 10-7 7-4	Hor x Vert Pixels	Bandwidth (MHz)	Refresh (Hz)	Scan (KHz)
16-inch Color, such as E-Machines	0 1 1	832 x 624	57.2832	75	49.7

PAL (1)					
PAL Option 1	0 0 0	underscan 640 x 480	14.75	50	15.625
		overscan 768 x 576	14.75	50	15.625
PAL Option 2 (2)	1 1 0	underscan 640 x 480	14.75	50	15.625
		overscan 768 x 576	14.75	50	15.625
VGA	1 0 1	640 x 480	25.175	59.95	31.47
Super VGA (3)	1 0 1	800 x 600	36	56	35.16
19" Color	1 1 0	1024 x 768	80	75	60.24
No external monitor (video halted)	1 1 1				

NOTES:
1. PAL has two wiring options, using the extended sense pin configuration. To produce a color PAL signal, an RGB-to-PAL converter is required.

2. This sense code also requires a diode between sense pins 10 and 7, with anode towards pin 7, cathode towards pin 10.

3. To enable Super VGA, after configuring and connecting the monitor for VGA, open the monitor's control panel and select Options. Choose Super VGA from the dialog and restart your system.

4. The Macintosh Quadra 700 and 900 support PAL Option 1 at up to 8 bpp.

5. The Macintosh Centris 610, 650, and Quadra 800 support PAL Option 1 at up to 16 bpp.

6. The Macintosh Quadra 950 supports PAL Option 1 up to millions of colors.

MACINTOSH QUADRA AND CENTRIS VIDEO PINOUTS:

Pin	Signal	Description
1	RED.GND	Red Video Ground
2	RED.VID	Red Video
3	CYSNC~	Composite Sync
4	MON.ID1	Monitor ID, Bit 1 (also known as SENSE0)
5	GRN.VID	Green Video
6	GRN.GND	Green Video Ground
7	MON.ID2	Monitor ID, Bit 2 (also known as SENSE1)
8	NC	No Connection
9	BLU.VID	Blue Video
10	MON.ID3	Monitor ID, Bit 3 (also known as SENSE2)
11	C&VSYNC.GND	CSYNC & VSYNC Ground
12	VSYNC~	Vertical Sync
13	BLU.GND	Blue Video Ground
14	HSYNC.GND	HSYNC Ground
15	HSYNC~	Horizontal Sync
Shell	CHASSIS.GND	Chassis Ground

If your monitor is a VGA type, try the following cable pinouts.

A cable wired as follows may allow many different brands of VGA monitors to work on a Macintosh Quadra. We advise you to test the monitor on a Macintosh Quadra prior to purchase to see if it meets your expectations.

Cable Pinouts:

Macintosh Video DB-15	Signal	VGA Connector

2	Red Video	1
1	Red Ground	6
9	Blue Video	3
13	Blue Ground	8
5	Green Video	2
6	Green Ground	7
15	Hsync	13
12	Vsync	14
14	Sync Ground	10
10	Connect 10 and 7 so the sense pin ID will equal VGA.	
7		

There are a few issues to keep in mind with VGA monitors.

* VGA monitors will vary depending on the vendor. Check with the vendor about Macintosh Centris and Quadra compatibility before buying, or better yet, actually try the monitor with a Centris or Quadra to see if it works and if the quality is acceptable.

* Vendors have different image quality specifications. There may be significant differences between Apple monitors and the wide range of VGA monitors. Do a side-by-side comparison of the monitors you are considering before buying.

* Many third party cable vendors have off-the-shelf cables that should work.

MACINTOSH QUADRA TO NTSC VIDEO CABLE:
Most NTSC devices use a RCA-type phono-connector and the following diagram uses that as a reference point. A cable wired as follows may allow many different brands of NTSC monitors to work on a Macintosh Centris or Quadra. We advise you to test the monitor on one of these machines prior to purchase to see if it meets your expectations.

Adjust the phono-connector side to whatever type of connector is used (RCA, BNC, etc.). "Tip" is the pin in the center of the connector (the signal); the sleeve is the flange around the outer edges of the connector (the chassis ground).

MACINTOSH QUADRA TO NTSC VIDEO CABLE EXAMPLE:

Card Connector	RCA-Type Phono-Connector
4 MON.ID1 (sense0) - - - -|	
7 MON.ID2 (sense1) - - - -|	
11 C&VSYNC.GND - - - - - - |	
5 GRN.VID ---------->	Tip (signal)
Shell CHASSIS.GND ---------->	Sleeve (ground)

Note: By grounding pin 4 and pin 7 to pin 11, the Macintosh Centris and Quadra CPUs are told that an interlaced (NTSC) monitor is attached. The actual black and white video signal is on pin 5 and connects to the center (Tip) of the phono-plug. The shell of the card connector connects to the sleeve of the phono-plug.

To acquire a color NTSC signal from a Quadra (or any Apple Macintosh display card), an RGB-to-NTSC converter is required, such as those available from RasterOps, Truevision, and Computer Friends. We do not have the cable requirements for any of these interface devices.

Business Basic III: VARIABLE ERROR in version 1.1 and earlier

This article has been archived and is no longer updated by Apple.

The most common cause for a variable error in versions 1.1 and earlier of Apple III Business Basic is to use SWAP with at least one of the arguments set to a null string: doing so creates an error in the string variable storage area. Unfortunately, these versions of Business Basic don't notice this error until they run short on storage space and try to consolidate all free space; the variable error occurs when the consolidation routine finds the swapped null string. The following fragment of code will generate this error:

```
10 T$ = "The little red fox jumped over the lazy dog's back ten times."
20 PRINT "Length of T$ is " LEN(T$); TAB(40); "Length of B$ is " LEN(B$)
30 SWAP T$, B$
40 PRINT "Length of T$ is " LEN(T$); TAB(40); "Length of B$ is " LEN(B$)
50 PRINT FRE
```

This problem has been fixed in versions 1.2 and later.

Published Date: Feb 18, 2012

Macintosh Quadra: Excess VRAM Gives No Performance Gain

Does extra VRAM in the Macintosh Quadra improve speed? For example, if I install 2MB of VRAM in a Macintosh Quadra and use a 13-inch RGB set to 256 colors, I get 1.5MB more than what is needed to display 256 colors. Does this improve the video performance/speed compared to 0.5MB?

This article has been archived and is no longer updated by Apple.
Having extra VRAM available on a Macintosh Quadra beyond what is required to support a particular pixel depth doesn't give any performance increase.

This is not true for the Macintosh Display Card 8*24 GC, where the additional and optional DRAM space is used for off-screen data structures.

Published Date: Feb 18, 2012

Macintosh Quadra: VRAM and Pixel Depth

Article Change History

03/23/93 - RETITLED
* To match another similar article.

I'm confused on the VRAM issue. If I can't run a 21-inch monitor in 24-bit using the full 2MB of VRAM, and I can run a 16-inch in 24-bit with only 1MB of VRAM, then what would I use the full 2MB of VRAM for? A 19-inch monitor maybe?

This article has been archived and is no longer updated by Apple.
The Macintosh Quadra 700 and 900 built-in video supports the Apple 21-inch color and monochrome monitors to 8-bit, 256 colors only. Adding VRAM beyond 1MB to the Macintosh Quadras when using these monitors is not beneficial; to achieve greater pixel depth on the 21-inch color monitor, you'll need a third-party video NuBus card.

A 19-inch monitor that matches the characteristics of other monitors the Macintosh Quadra supports may work; however, none of the other monitors are specifically 19-inch monitors.

The following chart should help explain the video expansion options available on the Macintosh Quadras today. Note that this information should supersede any information you have received thus far.

The following chart lists the Macintosh Quadra 700 and 900 internal video's maximum pixel depths supported, depending upon the VRAM configuration:

Display size	512K VRAM	1MB VRAM	2MB VRAM
12-inch landscape 384 x 512, such as 12-inch RGB	8 bpp	24 bpp	24 bpp
12-inch Monochrome 640 x 480	8 bpp	8 bpp	8 bpp
13-inch RGB and VGA 480 x 640	8 bpp	8 bpp	24 bpp
Super VGA 800 x 600	8 bpp	8 bpp	24 bpp
15-inch Portrait (b/w) 640 x 870	4 bpp	8 bpp	8 bpp
16-inch Color 832 x 624	8 bpp	8 bpp	24 bpp
2-Page Display (b/w) 870 x 1152	4 bpp	8 bpp	8 bpp
21-inch Color 870 x 1152	4 bpp	8 bpp	8 bpp
PAL with convolution	n.a.	8 bpp	8 bpp
PAL without convolution	8 bpp	8 bpp	24 bpp*

NTSC with convolution n.a 8 bpp 8 bpp

NTSC without convolution 8 bpp 8 bpp 24 bpp

* Note: there are two ways to wire a video cable for connecting a PAL monitor to a Macintosh Quadra; only by using the proper extended sense code are you able to achieve 24 bits per pixel. For details, search under "Quadra" and "video sense pinouts".

Note that 512K of VRAM is the minimum configuration for the Macintosh Quadra 700; it is 1MB of VRAM for the Macintosh Quadra 900.

A/UX: Commando Supports Only 7-bit Characters

Article Change History

08/31/92 - REVIEWED
* For technical accuracy.

The CMDO facility in A/UX seems to be unable to handle national characters (that is, 8-bit characters) in the CMDO-scripts. Is this a known problem?

This article has been archived and is no longer updated by Apple.
The Commando facility supports only 7-bit characters under A/UX 2.0.1. We have also verified that it supports only 7-bit characters under A/UX 3.0.

Macintosh Computers: Gestalt ID Codes

I need a list of the Gestalt machine-selector codes for all Macintosh Computers.
This article has been archived and is no longer updated by Apple.
Here is a list of the gestaltMachineType response values. You can use Apple System Profiler to obtain the Machine ID. It is listed in the System Profile tab in the Hardware overview section.

```
gestaltClassic           =  1;     { Macintosh }
gestaltMacXL             =  2;     { Macintosh XL }
gestaltMac512ke          =  3;     { Macintosh 512Ke }
gestaltMacPlus           =  4;     { Macintosh Plus }
gestaltMacSE             =  5;     { Macintosh SE }
gestaltMacII             =  6;     { Macintosh II }
gestaltMacIIx            =  7;     { Macintosh IIx }
gestaltMacIIcx           =  8;     { Macintosh IIcx }
gestaltMacSE30           =  9;     { Macintosh SE/30 }
gestaltMacPortable       = 10;     { Macintosh Portable }
gestaltMacIIci           = 11;     { Macintosh IIci }
gestaltMacIIfx           = 13;     { Macintosh IIfx }
gestaltMacClassic        = 17;     { Macintosh Classic }
gestaltMacIIsi           = 18;     { Macintosh IIsi }
gestaltMacLC             = 19;     { Macintosh LC }
gestaltQuadra900         = 20;     { Macintosh Quadra 900 }
gestaltPowerBook170      = 21;     { Macintosh PowerBook 170 }
gestaltQuadra700         = 22;     { Macintosh Quadra 700 }
gestaltClassicII         = 23;     { Macintosh Classic II }
gestaltPowerBook100      = 24;     { Macintosh PowerBook 100 }
gestaltPowerBook140      = 25;     { Macintosh PowerBook 140 }
gestaltQuadra950         = 26;     { Macintosh Quadra 950}
gestaltMacLCIII          = 27;     { Macintosh LC III }
gestaltPowerBookDuo210   = 29;     { Macintosh PowerBook Duo 210 }
gestaltMacCentris650     = 30;     { Macintosh Centris 650 }
gestaltPowerBookDuo230   = 32;     { Macintosh PowerBook Duo 230 }
gestaltPowerBook180      = 33;     { Macintosh PowerBook 180 }
gestaltPowerBook160      = 34;     { Macintosh PowerBook 160 }
gestaltMacQuadra800      = 35;     { Macintosh Quadra 800 }
gestaltMacQuadra650      = 36;     { Macintosh Quadra 650 }
gestaltMacLCII           = 37;     { Macintosh LC II }
gestaltPowerBookDuo250   = 38;     { Macintosh PowerBook Duo 250 }
gestaltAWS9150_80        = 39;     { Workgroup Server 9150 }
gestaltPowerMac8100_110  = 40;     { Power Macintosh 8100/110 }
gestaltPowerMac5200_75   = 41;     { Power Macintosh 5200/75 }
gestaltPowerMac6200_75   = 42;     { Power Macintosh 6200/75 }
gestaltMacIIvi           = 44;     { Macintosh IIvi }
gestaltPerforma600       = 45;     { Macintosh Performa 600 }
gestaltPowerMac7100_80   = 47;     { Power Macintosh 7100/80 }
gestaltMacIIvx           = 48;     { Macintosh IIvx }
gestaltMacColorClassic   = 49;     { Macintosh Color Classic }
gestaltPowerBook165c     = 50;     { Macintosh PowerBook 165c }
gestaltMacCentris610     = 52;     { Macintosh Centris 610 }
gestaltMacQuadra610      = 53;     { Macintosh Quadra 610 }
gestaltPowerBook145      = 54;     { Macintosh PowerBook 145 & 145b}
gestaltPowerMac8100_100  = 55;     { Power Macintosh 8100/100 }
gestaltMacLC520          = 56;     { Macintosh LC 520 }

gestaltPowerBookDuo280c  =103;     { Macintosh PowerBook Duo 280c }
gestaltPowerMac7200_90   =108;     { Power Macintosh 7200/90 }
gestaltPowerMac7300      =109;     { Power Macintosh 7300 }
gestaltPowerMac7100_66   =112;     { Power Macintosh 7100/66 }
gestaltPowerBook150      =115:     { Macintosh PowerBook 150 }
gestaltPowerBookDuo2300  =118;     { Macintosh PowerBook Duo 2300 }
gestaltPowerBook190      =122;     { Macintosh PowerBook 190 }
gestaltPowerBook5300     =128;     { Macintosh PowerBook 5300 }
gestaltPowerBook1400     =310;     { Macintosh PowerBook 1400 }
gestaltPowerMacG3        =510;     { Power Macintosh G3 }
```

Macintosh Processor Upgrade

The follow gestalt identifiers are used by the Macintosh Processor Upgrade, when installed in an eligible 68LC040-based system. When the card is active, the following gestalt identifiers are used:

```
gestaltPowerMac475       =104;     { Power Macintosh 475/605 }
gestaltPowerMac575       =105;     { Power Macintosh 575 }
gestaltPowerMac630       =106;     { Power Macintosh 630 }
gestaltPowerMac580       =107;     { Power Macintosh 580 }
```

Power Macintosh Upgrade Card

The following gestalt identifiers are used by the Power Macintosh upgrade card, when installed into an eligible 040-based system. When the card is active, the following gestalt identifiers are used:

```
gestaltPowerMac700       =116;     { Power Macintosh 700 }
gestaltPowerMac900       =117;     { Power Macintosh 900 }
gestaltPowerMac950       =118;     { Power Macintosh 950 }
gestaltPowerMacC610      =119;     { Power Macintosh C610 }
gestaltPowerMacC650      =120;     { Power Macintosh C650 }
gestaltPowerMacQ610      =121;     { Power Macintosh Q610 }
gestaltPowerMacQ650      =122;     { Power Macintosh Q650 }
gestaltPowerMac800       =123;     { Power Macintosh 800 }
```

Power Macintosh G3

All Power Macintosh G3 computers have a machine ID value of 510 (hexadecimal 1FE). The ROM subversion can help differentiate logic boards. Details can be found in the developer note.

New World ROM computers
Computers based on the New World ROM architecture, such as the Power Macintosh G3 (Blue and White), iMac, PowerBook G3 Series (Bronze keyboard), and later, all have a machine ID of 406.

Gestalt

This Note now documents _Gestalt selectors and return values added since the release of Inside Macintosh Volume VI. Please note that this is supplemental information; for the complete description of _Gestalt and its use, please refer to Inside Macintosh Volume VI.

The Macintosh LC II is identical to the Macintosh LC except for the presence of an MC68030 processor, so under System 7.0.1 it returns the same gestaltMachineType response as the Macintosh LC (that is, 19). However, under System 7.1 and later, the LC II responds to a gestaltMachineType selector with the value 37. Thus, there are two cases when you are on an LC II: under System 7.0.1, you will get a gestaltMachineType response of gestaltMacLC (19), but gestaltProcessorType will return gestalt68030; under future system software,gestaltMachineType will return gestaltMacLCII (37). The processor will, of course, still be a 68030.

There is a similar difficulty with the PowerBook 145. This is essentially a PowerBook 140 with a 25-MHz 68030 processor. Under System 7.0.1, it returns the gestaltMachineType response of gestaltPowerBook140 (25); under System 7.1 and all later system software versions, the value returned is gestaltPowerBook145 (54).

Performa computers have the same gestaltMachineType resources as their Macintosh counterparts.

Developers are reminded that the gestaltMachineType selector is for informational purposes only and should not be used as a basis for programmatic decisions. As always, developers are encouraged to test for the specific features they need and not to rely on any particular machine having a particular set of features.

Notes

The Macintosh PowerBook 100 Developer Notes and the Macintosh PowerBook 140/170 Developer Notes incorrectly document gestaltMachineType response values for the Macintosh PowerBook computers. The above values are, and have always been, the correct values.

The following Tech Info Library article can help you find the Tech Notes mentioned in this article:

Article 24493: "**Apple Tech Notes: What They Are, Where To Find Them**"
Published Date: Feb 18, 2012

System 7: MODE32 Technical Information (9/94)

Apple's announcement regarding the licensing of MODE32 from Connectix prompted a number of questions about how MODE32 works at a technical level. This document addresses these issues.

This article has been archived and is no longer updated by Apple.
MODE32 is system-level software designed for Macintosh II class systems with ROMs that aren't 32-bit clean (Macintosh II, Macintosh IIx, Macintosh IIcx, and Macintosh SE/30). This became an issue with the release of System 7, because these computers can't run in 32-bit mode. MODE32 allows these computers to run in 32-bit mode.

When installed, MODE32 directly modifies the System file. Virus utilities report this, and may interfere with installation. Turn virus utilities off for the installation.

Modifications to the System file involve:

1) Total replacement of the Memory Manager with a 32-bit clean Memory Manager. This is the biggest change made. Without a 32-bit clean Memory Manager, you can't use 32-bit addressing.

2) Minor patches to certain ROM routines that aren't 32-bit clean. This involves patching specific routines in some managers, not replacing the entire manager as is the case with the Memory Manager.

NOTE: The MODE32 Control Panel (not the Memory Control Panel) can remove most of the resources it installed in the System file . The only portion MODE32 can't remove is a "ptch" resource in the System file, modified to allow 32-bit addressing on older Macintosh computers. To return to a golden master version of System 7, you must reinstall it from Master disks. This should not be an issue, as the updated "ptch" resource works in both 24-bit and 32-bit mode. We aren't aware of any problems when using this modified resource instead of the original.

When you turn your Macintosh on (or restart it), MODE32 executes at the earliest point possible in the startup process. Here is the sequence of events:

1) The Macintosh starts up in 24-bit mode.

2) Drivers load into 24-bit space from each of the installed NuBus cards and from any attached hard drive.

3) MODE32 executes.

4) MODE32 issues a close call to open drivers, switches in the 32-bit Memory Manager, and then reloads the drivers into 32-bit space. We call this process the "stutter start."

5) System start up proceeds normally from this point, and includes loading the other MODE32 patches to specific ROM routines.

NOTE: Some third-party NuBus cards don't have 32-bit clean drivers in their ROMs. Computers with these cards installed, and 32-bit addressing turned on, will fail to start up. The symptom you are most likely to see is repeated unsuccessful attempts to start up. Many manufacturers of cards that aren't 32-bit clean have ROM upgrades that resolve this issue. Disk drivers that are not 32-bit clean are also an issue. Contact the vendor of your drive software and obtain a vendor-certified 32-bit clean version.

Hardware Issues

The main benefit of 32-bit addressing is the ability to address more than 8MB of physical RAM. Even with 8MB of RAM you gain access to more virtual memory, assuming you have either a 68030-based Macintosh or a Macintosh II with a PMMU installed. A side benefit of 32-bit addressing when using virtual memory is that your address space is contiguous. This isn't true in 24-bit mode since ROM is mapped directly above the 8MB allocated for RAM. In 24-bit mode, any virtual memory allocated beyond 8MB is not contiguous with the first 8MB.

Macintosh II and Macintosh IIx computers require special 4MB SIMMs to give you more than 8MB of RAM. You should specifically request these SIMMs, and the vendor you purchase RAM from should be aware of the difference.

NOTE: To take advantage of more than 8MB of physical RAM in a Macintosh II, you must have a PMMU installed. When a Macintosh II starts up, MODE32 uses the PMMU to give you access to the additional RAM. Also, a Macintosh II won't start up if you have 4MB SIMMs in bank

A. You'll hear chimes, indicating a hardware failure. However, you can install the 4MB SIMMs in bank B with 1MB or 256K SIMMs in bank A. The Macintosh II then starts up, and MODE32 uses the PMMU to give you access to the additional RAM.

When you turn the power on (not restart from the Special menu), your Macintosh performs a RAM test. However, older systems only check up to 8MB of RAM, so anything beyond this isn't tested. MODE32 resolves this by checking anything greater than 8MB at the "happy Macintosh" screen. With large amounts of RAM, this can take a long time, and your computer can appear to freeze at this point.

Software Compatibility

We have no reports of 32-bit clean software incompatibilities with MODE32. In a few instances, problems with programs surfaced after installing MODE32.

NOTE: There is a version of Adobe Type Manager (2.0.2 or later) that is 32-bit clean. Be sure to use this version. The symptoms of a Macintosh running older versions of ATM make it appear as if applications may not be 32-bit clean, when the problem is actually an old version of ATM.

PowerBook: HDI-30 Throughput (7/92)

I would like to match external hard disks to the Macintosh PowerBook 140 and 170. Can you tell me the throughput of the SCSI port on these PowerBooks?

This article has been archived and is no longer updated by Apple.
The SCSI circuitry used on the Macintosh PowerBooks (and consequentially, the throughput of the port) is the same as that used in all Macintosh computers. The new HDI-30 SCSI port connector has the same signals as the DB-25 connector, and the HDI-30 throughput is the same as other Macintosh computers.

Hard disks compatible with the Macintosh IIci, for example, work with the Macintosh PowerBooks.

AppleTalk Remote Access on Token Ring

Can I use AppleTalk Remote Access with Token Ring?
This article has been archived and is no longer updated by Apple.
Yes. The TokenTalk installer that ships with the Token Ring 4/16 NB Card will include AppleTalk version 57, which is required for AppleTalk Remote Access.

NOTE: The AppleTalk Remote Access READ ME file states that "Answering calls on a Token Ring network is not supported as of TokenTalk version 2.2..." The new TokenTalk driver for the Token Ring 4/16 NB card utilizes AppleTalk version 57, which is required for AppleTalk Remote Access. So, AppleTalk Remote Access is now fully functional on a Token Ring network.

Applesoft: A program to simulate PRINT USING

The listing below demonstrates how Applesoft can simulate the BASIC statement PRINT USING.
This article has been archived and is no longer updated by Apple.
This particular example shows a subroutine that formats numeric output into a "Dollars and Cents" format. It's simple and fairly fast. It assumes that the calling program has initialized the following:

X, containing the number to be printed,
N, containing the number of digits to the right of the decimal, and
S, containing the width of the right justified printing field

The subroutine starting at line 1000 does all the work.

```
100 REM PRINT USING SIMULATOR
130 REM
140 LET N = 2: REM SET NUMBER OF DECIMALS
160 LET S = 5: REM SET FIELD WIDTH
180 HOME
190 FOR X = - 5 TO 5 STEP .501
200 PRINT X,"$";
210 GOSUB 1000
220 NEXT X
230 PRINT
240 PRINT "UNFORMATTED FORMATTED"
250 END
1000 LET X$ = " " + STR$(INT(X * 10^N +.5))
1010 LET Q = LEN(X$) - (VAL(X$) < 0)
1020 PRINT SPC(S - Q * (Q > N+1) - (N+2) * (Q <= N+1));
1030 PRINT MID$ (X$,1 + (VAL(X$) < 0), (Q <= N) + (Q-N) * (Q > N));
1040 PRINT MID$ ("0.00", 1 + ((N+1) < Q), 1 + (N-Q+2) * (Q < N+2));
1050 PRINT RIGHT$ (X$, N * (Q > N) + (Q-1) * (Q <= N));
1060 RETURN
```

AppleTalk Remote Access: Answers Only One Call at a Time

Can several people call into AppleTalk Remote Access simultaneously?

This article has been archived and is no longer updated by Apple.

Because AppleTalk Remote Access was designed as a personal networking service geared toward the individual, it can answer only one call at a time. In addition, Apple wanted the product to be both affordable and easy to set up. Allowing more than one line would increase its complexity and cost.

AppleWorks 6: Presentation Transitions Do Not Work When Mirroring

When mirroring an AppleWorks 6 presentation to a second display, slide transitions do not appear on the mirrored display, or they may appear to stutter as they are drawn.
This article has been archived and is no longer updated by Apple.

Symptom

When mirroring an AppleWorks 6 presentation, slide transitions do not appear on the mirrored display, or they may appear to stutter as they are drawn.

Solution

Update to AppleWorks 6.2 or later and QuickTime 5 or later. You may get updates from Apple Software Downloads (http://www.apple.com/swupdates/).

Apple Remote Access: Use AppleEvents at 9600 bps

Can I use AppleEvents over an Apple Remote Access (ARA) connection?
This article has been archived and is no longer updated by Apple.
Yes. Any AppleTalk based service should work fine.

However, there may be time-out problems at low modem speeds. In the case of AppleEvents, the NBP time-out value is not long enough to handle speeds lower than 9600 bps.

Apple Remote Access: AppleTalk Phase I and Phase II

Can Apple Remote Access (ARA) work on Phase I and II AppleTalk networks?

This article has been archived and is no longer updated by Apple.

No version of Apple Remote Access was tested on a network using AppleTalk Phase I and is therefore not supported. Although ARA may work on some network configurations that are using both AppleTalk Phase I and Phase II you do so at your own risk.

There are no practical reasons for continuing to use Phase I on AppleTalk networks, Apple strongly recommends using Phase II.

AppleTalk Remote Access: AppleTalk v57 and Multinode

Does AppleTalk Remote Access (ARA) 1.0 use a new version of AppleTalk?
This article has been archived and is no longer updated by Apple.
Yes. A new version of AppleTalk (version 57) was created specifically for AppleTalk Remote Access. One of the key components in version 57 is a new technology called "multinode." Multinode allows an AppleTalk device (that is, a Macintosh) to acquire and defend multiple AppleTalk nodes.

Apple Remote Access version 2.0 installs AppleTalk version 58.1.3 on your Macintosh.

NOTE: Some older routers may have problems in dealing with the multinode technology. In these rare cases, NBP lookups may not get returned, making it look as if there are no services on the network you've called.

AppleTalk Remote Access 1.0: Coexisting w/ Other Products

Can I install and use these products on the same Macintosh with AppleTalk Remote Access (ARA) v1.0?

- AppleShare 2.0
- AppleShare Server 3.0
- AppleTalk Internet Router 2.0
- Apple SNA*ps Gateway

This article has been archived and is no longer updated by Apple.

AppleShare 2.0

AppleShare 2.0 doesn't work with System 7. Because AppleTalk Remote Access only runs on System 7, this combination won't work.

AppleShare Server 3.0

AppleTalk Remote Access and AppleShare Server 3.0 work together on the same Macintosh. In this configuration, Remote Access users are administered via the AppleShare Server 3.0 Admin program.

AppleTalk Internet Router 2.0

AppleTalk Remote Access and the AppleTalk Internet Router 2.0 cannot run concurrently on the same Macintosh.

Apple SNA'ps Gateway

The SNA'ps Gateway product and AppleTalk Remote Access can reside and run on the same Macintosh.

Published Date: Feb 18, 2012

AppleTalk Remote Access 1.0: Memory Requirements

How much memory does AppleTalk Remote Access (ARA) require in its minimum configuration? Can I run my favorite word processor and spreadsheet while maintaining a remote link to a network?
This article has been archived and is no longer updated by Apple.
AppleTalk Remote Access 1.0 requires approximately 450K of RAM when calling into another Remote Access system; answering requires an additional 110K of RAM. Generally speaking, this would leave between 230-330K of memory free
in a 2MB system for other activities.

You can quit the Remote Access application while maintaining the remote connection. This frees roughly 200K of memory.

AppleTalk Remote Access works well in a 2MB environment. But if you want to keep several applications open (using the multitasking feature of System 7) while maintaining a remote connection, you should consider increasing the RAM in your system.
Published Date: Feb 18, 2012

AppleTalk Remote Access: Writing Modem Scripts

Is there any documentation available to help write modem scripts for AppleTalk Remote Access (ARA)?
This article has been archived and is no longer updated by Apple.
Those interested in writing their own scripts can order the "AppleTalk Remote Access Modem Toolkit" (part number R0129LL/A) from APDA, Apple's source for developers' tools. This kit provides all the tools and information necessary to build an AppleTalk Remote Access modem script.

Apple Remote Access MultiPort Server comes with the Modem WorkShop. It includes instructions for writing scripts and descriptions of all the CCL commands. It is intended for experienced programmers with a good understanding of telecommunications and modem operations.

TA47467_LisaDraw_Printing_point_bold_italic_text_(TIL00911).pdf

LisaDraw: Printing 18-point bold italic text

This article has been archived and is no longer updated by Apple.
Even though 18-point bold italic appears to be fine on the screen, it may grow 10 to 15% in size when printed, possibly overrunning any boxes it may have been placed in or graphics it was placed close to.

AppleTalk Remote Access: Modem Speed Requirements

Can I use any speed modem with AppleTalk Remote Access (ARA) v 1.0 or Apple Remote Access 2.0?

This article has been archived and is no longer updated by Apple.

Any modem with a data rate of 2400 bps or higher can work with either. Most importantly, you need the appropriate modem script for your modem. Apple recommends 9600 bps or higher for best performance. Contact your modem vendor for the latest modem script.

Published Date: Feb 18, 2012

AppleTalk Remote Access: Compatible Modems

What modems are compatible with AppleTalk Remote Access 1.0 (ARA) and Apple Remote Access 2.0?
This article has been archived and is no longer updated by Apple.
ARA can work with any modem for which a special modem communications script has been written. AppleTalk Remote Access includes scripts for a variety of popular modems on the disks. Contact your modem vendor for updates to your modem script.

AppleTalk Remote Access includes scripts for the following modems:

v.22/2400 bps Modems

All Apple 2400 bps modems
Abaton InterFax 24/96
Global Village TelePort
Hayes SmartModem 2400
Microcom Microport 1024
Practical Peripherals 2400SA
Prometheus 2400M
Supra SupraModem 2400
US Robotic Courier 2400e

v.32/9600 & v.32bis bps Modems

DSI 9624 LE/LE Plus
Hayes Ultra 96
Farallon Remote V.32
Microcom MacModem V.32
MultiTech MultiModemV32
Practical Peripherals 9600SA
Prometheus ProModem Ultima
Telebit T1600
US Robotics Courier V.32 bis

AppleTalk Remote Access: Using w/ Apple IIe Emulation

Can I use AppleTalk Remote Access (ARA) in Apple II emulation mode on a Macintosh LC with an Apple IIe Card?

This article has been archived and is no longer updated by Apple.

Yes. You must establish the connection before going into emulation mode. Once established, you can access network services via the Apple II control panel.

Published Date: Feb 18, 2012

AppleTalk Remote Access: Securing the AppleTalk Network

Are services and workstations on an AppleTalk network secure against unauthorized access from a dial-up link?
This article has been archived and is no longer updated by Apple.
AppleTalk Remote Access has several sophisticated security options that allow both the individual user and the network administrator to restrict access to an individual computer or any network to which it is connected.

User-Controllable Options

- User name and password authentication. Callback verifies the user's identity by returning calls to a predetermined phone number.
- An Activity Log for recording calling and answering activities.
- Disabling of user account after seven incorrect password attempts.

Network Administrator Options

Answering authentication allows a network administrator to password-protect the network from unauthorized remote access. This is enabled by creating a unique security zone (SecurityZone_) on the Internet. The administrator uses a special HyperCard stack to generate the SecurityZone and encrypted password.

This HyperCard stack and documentation is available on the two APDA AppleTalk Remote Access toolkits, on several on-line services, and on the Information Source CD-ROMs.
Published Date: Feb 18, 2012

Apple Remote Access: Using Personal File Sharing

Can I use Macintosh File Sharing at the same time as Apple Remote Access (ARA)? Are other network services available to me through the Remote Access product?

This article has been archived and is no longer updated by Apple.

Yes. Macintosh Personal File Sharing and Apple Remote Access Personal Server or Client can coexist on the same system without any problems. With this combination, access to files on your home or office computer is available from anywhere.

You cannot however, use the ARA MultiPort Server software concurrently with Personal File Sharing. The ARA MultiPort Server software uses the same Users & Groups file format as the AppleShare File Server, so Personal File Sharing is disabled. Also Apple Remote Access MultiPort Server is not compatible with AppleShare 3.0.x. AppleShare 4.0.1 and later are the correct AppleShare versions to use.

In addition, if the answering Macintosh is connected to an AppleTalk network, all the network resources like E-mail, file services, group calendars, host gateways, and so on (assuming the presence of network software and gateways needed) will be available. The only caveat is that the calling Macintosh must have the appropriate client software installed in order to use these services.

Published Date: Feb 18, 2012

AppleTalk Remote Access: Doesn‘t Power On Remotely

If the Macintosh I wish to dial into is not powered on, can AppleTalk Remote Access (ARA) wake it up?
This article has been archived and is no longer updated by Apple.
AppleTalk Remote Access does not have the ability to turn on power to a remote Macintosh.

There are third-party "wake up" products you can use in conjunction with AppleTalk Remote Access. After you wake up the Macintosh with one of these products, you can call back the remote Macintosh and connect in the normal fashion with AppleTalk Remote Access. Sophisticated Circuits offers such a remote "wake up" product called PowerKey Remote.
Published Date: Feb 18, 2012

Apple Remote Access: Works in the Background

When you turn Remote Access (ARA) answering on, can you still use the system for other things?
This article has been archived and is no longer updated by Apple.
Yes. AppleTalk Remote Access 1.x, 2.x, and Apple Remote Access 3.x work completely in the background.
Published Date: Feb 18, 2012

PowerBook: Disable ARA "Answer Calls" to Send Fax (11/94)

I'm having difficulty sending a Fax from my Macintosh PowerBook 170 with internal AppleFax Modem. Everything seems fine until just after the Fax Monitor Status says "Imaging Document." I get a status of "Waiting for modem" and it never dials. I tried sending the sample document included with the Fax software as well as sending a document from within MacWrite. This seems to be a problem only with the Macintosh PowerBook 170 and Fax.

This article has been archived and is no longer updated by Apple.
You need to disable the Remote Access Setup (ARA) "Answer Calls" option. As long as the Remote Access Setup "Answer Calls" option is enabled, the Macintosh PowerBook AppleFax Modem software will remain in a "Waiting for modem" status when trying to send a Fax.

DAL for A/UX: Details and System Requirements

This article gives the product details, language specifications, and system requirements for using Data Access Language (DAL) for A/UX.
This article has been archived and is no longer updated by Apple.
NOTE: As of December 1993, Independence Technologies, Inc. (ITI) took ownership of the DAL technology. Contact ITI for current product information.

Product Details

- Database Support
- Informix version 2.1 or later
- Ingres version 6.1 or later
- Oracle version 6.0

- Client Support
Uniform support for any application developed with the DAL Developer's Toolkit for the Macintosh using a supported network

- Network Support
- Asynchronous direct and dial-up connections
- Support for TCP/IP standard UNIX network protocol using Apple's MacTCP software program on the Macintosh computer.

- Asynchronous Communications
- Transmission speed: 300 to 19,200 baud
- Character length: 7 or 8 data bits; 1 or 2 stop bits
- Parity: odd, even, or none
- Handshake
- XON/XOFF and none
- Modem and direct connections
- Log-on sequence specification
- Protocol
- Error-correcting (16-bit CRC)
- Data compression
- Binary data transparency

Language Specifications

DAL is a complete language for describing connectivity tasks. It consists of these statement groups:

- Host Connection Statements
These establish and terminate a connection to a host system in the network. This provides concurrent access to multiple hosts running DAL Servers.

- Data Manipulation Statements
These offer complete ANSI standard level 1, SQL-based data access to host databases.

- Program Structure Statements
These support testing, looping, and procedure calls within a DAL program.

- Output Statements
These generate output messages from the DAL program. The client application software processes these messages.

System Requirements

To use the DAL Server for A/UX, you need the following hardware and software:

- Host environment: A/UX version 2.0 or later. We recommend the A/UX CD-ROM product or the A/UX floppy product. We don't recommend the A/UX external 80MB hard disk because it doesn't contain the software you need to repartition the disk for the DAL Server for A/UX.

- One of the supported database management systems

- Macintosh computer clients running DAL-compatible application programs.

- The appropriate networking hardware and software

AppleWorks: Printing from Brother Printer

This article describes printing tips to use with a Brother Printer when printing from AppleWorks using an Apple IIc or IIe computer.
This article has been archived and is no longer updated by Apple.
Since the Brother printer requires certain escape sequences to include a CTRL-I, the escape sequences in the Brother Manual may have to be modified in order to avoid interface cards from "trapping" the CTRL-I in the card. This occurs in the following situations:

1. Apple IIe with Super Serial Card -- add the following IN FRONT OF THE NORMAL SEQUENCE: <CTRL-I> Z RETURN

2. Apple IIc -- add the following IN FRONT OF THE NORMAL SEQUENCE: <CTRL-I> Z

3. Apple IIe with Apricorn parallel card and parallel Brother printer add the following IN FRONT OF THE NORMAL SEQUENCE: <CTRL-I> <CTRL-A>

Also, Brother's 10-pitch command requires a carriage return as part of the sequence, which does not appear to ever get to the printer. Instead, use the "set to switch command" (<ESC>S) to get back to 10-pitch.

BEST DIP SWITCH SETTINGS FOR APRICORN PARALLEL CARD

Switch	1	2	3	4
ON	X	-	-	-
OFF	-	X	X	X

These settings force an 80-column mode and turn off the screen while printing, just like the serial card does.

APPLEWORKS PRINTER CODES TO USE:

Interface Cards (version 1.2) -- none

10-pitch -- <ESC>S

12-pitch -- <ESC><CTRL-_><CTRL-K>

15-pitch -- Super Serial Card: <CTRL-I>Z<RETURN><ESC><CTRL-_><CTRL-I>

IIc: <CTRL-I>Z<ESC><CTRL-_><CTRL-I>

Parallel Card: <CTRL-I><CTRL-A><ESC><CTRL-_><CTRL-I>

6-LPI -- Super Serial Card: <CTRL-I>Z<RETURN><ESC><CTRL-6><CTRL-I>

IIc: <CTRL-I>Z<ESC><CTRL-6><CTRL-I>

Parallel Card: <CTRL-I><CTRL-A><ESC><CTRL-6><CTRL-I>

8-LPI -- <ESC><CTRL-6><CTRL-G>

Bold Begin: <ESC>F	Bold End: <ESC>&
Subscript Begin: <ESC>U	Subscript End: <ESC>D

Quadra 900 & 950: Internal Hard Drives Must Not Be Terminated

Internal hard drives on the Quadra 900 & 950 must NOT be terminated. All Apple and third-party internal SCSI drives have terminating resistors that must be removed before installing in the Quadra 900 & 950.

This article has been archived and is no longer updated by Apple.
If an internal hard drive is terminated, it will likely damage the Quadra 900 & 950's logic board. This occurs because the Quadra 900 & 950's logic board has active SCSI termination. If a SCSI device is installed with terminating resistors, it will overload the SCSI chip on the logic board and probably cause it to fail. Adding more SCSI devices will increase the load on the SCSI chip and make the failure more likely.

This situation is noted in the Technical Procedures for the Quadra 900 & 950 on
pages 1.6 and 2.11.

Article Change History:

29 Nov 1994 - Reviewed and updated.
26 Jan 1993 - Updated to include the Quadra 950.

DAL Server for MVS/VTAM: Features & Benefits

This article describes the Data Access Language (DAL) Server for MVS/VTAM.
This article has been archived and is no longer updated by Apple.
The DAL Server for MVS/VTAM is a multi-user server product that provides DAL access to IBM Database 2 (DB2) and Teradata DBC/1012 databases on an MVS host system. The DAL Server works cooperatively with personal computer applications that support DAL (such as spreadsheets, databases, and query tools running on Macintosh computers) while running under MVS, either directly through native VTAM or under CICS.

A complete connectivity setup for MVS includes a client personal computer running an application with embedded DAL support and an MVS host with the DAL Server. The DAL Server receives requests from the personal computer application, carries them out on MVS against DB2 or DBC/1012, and sends the desired data back to the application for desktop processing.

The DAL Server for MVS/VTAM provides uniform support for DAL-based applications. It works with existing DB2 and DBC/1012 databases, operating under standard MVS, DB2, and Teradata security. As a result, you receive transparent access to the data that you have authorization to access.

Features

- Operates as an MVS Batch Job either directly accessed through native VTAM or a CICS Passthru connectivity

- Uniform support for DAL clients

- Asynchronous operation

- Incremental compiler implementation

- Trace facility

- Additional product, an interactive utility (IDAL) for testing DAL program statements

- Stored procedures

- Sample tables

- Support for Macintosh computers connected by way of Apple's Coax/Twinax, TokenTalk NB and Serial NB cards, Avatar's MacMainFrame, DCA's MacIRMA, TriData's Netway 1000/2000 products, Apple's SNA*ps APPC and 3270 Gateways as well as asynchronous dial-in to a protocol converter (supporting VT100 terminal type).

- Support for Macintosh computers connected asynchronously to a host computer with a compatible protocol converter installed

Benefits

- Maintains the security and integrity of MVS, DB2, and Teradata systems.

- Allows one server to support all personal computers running DAL-compatible Macintosh applications.

- Once the connection is made, returns program control to the Macintosh so that the user can perform other tasks while the DAL Server carries out the requested operation on the host.

- Improves performance for repetitive requests.

- Reduces the client system processing load.

- Facilitates debugging and system tuning.

- Minimizes network traffic by storing commonly executed procedures on the host, where they can be shared.

- Makes developing and testing applications easier.

- Allows you to run applications on Macintosh computers regardless of the hardware connection to the host.

DAL Developer‘s Toolkit for Macintosh: Details & Requirements

This article gives the product details, language specifications, and system requirements for the Data Access Language (DAL) Developer's Toolkit for the Macintosh.
This article has been archived and is no longer updated by Apple.

Product Details

- Supplied Software
- DAL device driver and driver installer
- C and Pascal call libraries
- Interactive DAL tester
- Sample applications, including source code
- DAL HyperCard XCMDs, including source code and sample stack
- DAL documentation in HyperCard Help stack

- Network Support
- Asynchronous communication, by way of direct or dial-up links
- Support for the AppleTalk network system based on the AppleTalk Data Stream Protocol (ADSP)
- Support for TCP/IP using Apple's MacTCP networking software
- Support for the 3270 data streams and APPC (LU6.2) networking protocols
- Support for connections to IBM hosts using Avatar's MacMainFrame, DCA's MacIRMA, and TriData's Netway 1000/2000 products
- Asynchronous communication to IBM hosts equipped with protocol converters

Language Specifications

DAL is a complete language for describing connectivity tasks. It consists of these statement groups:

- Host Connection Statements
These establish and terminate a connection to a host system in the network, providing concurrent access to multiple hosts running DAL Servers.

- Data Manipulation Statements
These offer complete ANSI standard level 1, SQL-based data access to host databases.

- Program Structure Statements
These support testing, looping, and procedure calls within a DAL program.

- Output Statements
These generate output messages from the DAL program. The client application processes these messages.

- Execute Statement
This permits execution of DBMS-specific commands not directly supported by DAL.

System Requirements

To use the DAL Developer's Toolkit for the Macintosh, you need the following hardware and software:

- A Macintosh personal computer

- Macintosh system software version 6.0.5 or later

- The appropriate hardware and software for a supported network

- Access to a host computer with a DAL Server, and a database management system and networking software supported by DAL.

Published Date: Feb 18, 2012

DAL Server for MVS/VTAM: Details and System Requirements

This article gives the product details, language specifications, and system requirements for using the DAL Server for MVS/VTAM.
This article has been archived and is no longer updated by Apple.

Product Details

- Database Support
- Provides access to DB2 databases, version 1.3 or later
- Provides access to Teradata DBC/1012 databases, version 4.1 or later

- Optional CICS Support

A CICS Passthru program runs as a standard CICS transaction program that provides optional CICS support.

- Client Support

Provides uniform support for any application developed with the DAL Developer's Toolkit for the Macintosh using a supported network.

- Network Support
- Provides 3270 data-stream and APPC support. Allows SNA or non-SNA connection.
- The client must have the supported 3270 hardware and software to emulate a 3278-type device or the supported hardware and software to do APPC communications:
- MacDFT software and either the Apple Coax/Twinax Card, Apple Serial NB Card, or the Apple TokenTalk NB Card for the Macintosh II family of computers
- Avatar's MacMainFrame, DCA's MacIRMA, and TriData's Netway 1000/2000 connectivity products
- Asynchronous support to hosts equipped with an appropriate protocol converter
- APPC (LU6.2) support via Apple's SNA*ps Gateway

- Resource Usage
- 1MB of disk storage
- 8MB of address space recommended
- Test program verifies correct installation and usage

Language Specifications

DAL is a complete language for describing connectivity tasks. DAL consists of these statement groups:

- Host Connection Statements

These establish and terminate a connection to a host system in the network, providing concurrent access to multiple hosts running DAL Servers.

- Data Manipulation Statements

These offer complete ANSI standard level 1, SQL-based data access to host databases and files.

- Program Structure Statements

These support testing, looping, and procedure calls within a DAL program.

- Output Statements

These generate output messages from the DAL program. The client application processes these messages.

System Requirements

To use the DAL Server for MVS/VTAM, you need the following software and hardware:

- Host Environment
- MVS/XA version 2.2 or later, or MVS/ESA version 1.0 or later running VTAM version 3.1 or later.
- For the CICS Passthru Program, CICS 1.7 or later with LU6.2 support is required.
- DB2 version 1.3 or later.
- Teradata DBC/1012 version 4.1 or later.

- Macintosh computer clients running DAL-compatible applications

- Appropriate networking hardware and software

Data Access Language Server for VAX/VMS: Features & Benefits

This article describes the Data Access Language (DAL) Server for VAX/VMS.
This article has been archived and is no longer updated by Apple.
The DAL Server for VAX/VMS is a networking software product that provides DAL access to files and databases on a VAX/VMS host system. The DAL Server runs on a VAX/VMS host and works cooperatively with personal computer applications that support DAL, such as spreadsheets, databases, and query tools on Macintosh computers.

A complete connectivity setup for VAX/VMS includes a client personal computer running an application with embedded DAL support, and a VAX/VMS host with the DAL Server. The DAL Server receives requests from the personal computer application, carries them out on the VAX, and sends the desired data back to the application for local processing.

The DAL Server for VAX/VMS provides uniform support for DAL-based applications, through a variety of network configurations and VAX/VMS data management software. It works with existing VAX/VMS databases, operating under standard VMS and database security. Your Macintosh computer receives transparent access to the VAX data you are authorized to access.

Features

- Server operates as a user process under standard VMS user name/password security

- Uniform support for DAL clients

- Uniform concurrent support for VAX databases

- Standard VAX/VMS installation procedures

- Asynchronous operation, after connection is established.

- Incremental compiler implementation

- Trace facility

- Interactive utility for testing DAL program statements

- Stored procedures

- Sample tables

- Wide range of commercial applications with DAL connectivity available

Benefits

- Maintains the security and integrity of VAX/VMS and the database management system.

- Eliminates the need for new system administration procedures on the VAX.

- Allows one server to support all Macintosh computers running DAL- compatible applications.

- Insulates personal computer applications from the complexities of the database used.

- Supports multivendor environments.

- Makes installation quick and easy.

- Returns program control to the Macintosh so the user can perform other tasks while the DAL Server carries out the requested operation on the host.

- Reduces the client system processing load.

- Facilitates debugging and system tuning.

- IDAL ensures proper connection, installation, and operation of host server.

- Minimizes network traffic by storing commonly located procedures on the host, where they can be shared.

- Makes developing and testing applications easier.

- Provides spreadsheet, query tool, and mapping tool users with seamless host data integration with no programming effort.

DAL Server for VAX/VMS: Details and System Requirements

This article gives the product details, language specifications, and system requirement for using Data Access Language (DAL) Server for VAX/VMS.
This article has been archived and is no longer updated by Apple.

Product Details

- Database Support
- Informix version 2.1 (or later)
- Ingres version 6.1 (or later)
- Oracle version 5.1.22 (or later)
- Oracle version 6.0
- Rdb/SQL version 3.1 (or later)
- Sybase SQL Server version 3.0 (or later)

- Client Support
Uniform support for any application developed with DAL Developer's Toolkit for the Macintosh using a supported network

- Network Support
- Asynchronous direct and dial-up connections
- Support for the AppleTalk network system (requires AppleTalk for VMS version 2.0.6 or later for Phase I and version 2.1 for Phase II), which is supplied with DAL Server for VAX/VMS.

- Asynchronous Communications
- Transmission speed: 300 to 19,200 baud
- Character length: 7 or 8 data bits; 1 or 2 stop bits
- Parity: odd, even, or none
- Handshake
- XON/XOFF and none
- Modem and direct connections
- Log-on sequence specification
- Protocol
- Error-correcting (16-bit CRC)
- Data compression
- Binary data transparency

- Resource Usage
- 1MB of disk storage
- Proper usage verified by test program
- One sharable, reentrant 200K-300K process shared by all attached
Macintosh applications

Language Specifications

DAL is a complete language for describing connectivity tasks. DAL consists of these statement groups:

- Host Connection Statements
These establish and terminate a connection to a host system in the
network, providing concurrent access to multiple hosts running DAL
Servers.

- Data Manipulation Statements
These offer complete ANSI standard level 1, SQL-based data access to host databases.

- Program Structure Statements
These support testing, looping, and procedure calls within a DAL program.

- Output Statements
These generate output messages from the DAL program. The Client application processes these messages.

System Requirements

To use the DAL Server for VAX/VMS, you need the following:

- Host environment: VAX/VMS version 5.1 (or later)

- Macintosh computer clients running DAL-compatible applications

- One or more of the supported database management systems

- The appropriate networking hardware and software

PowerBook: Which Models Support SCSI Disk Mode

Which PowerBook models allow mounting of the PowerBook computer's internal hard drive as a Small Computer Systems Interface (SCSI) device on the SCSI chain of a desktop Macintosh computer, also called SCSI Disk Mode?
This article has been archived and is no longer updated by Apple.
PowerBook Models Using SCSI Disk Mode
The SCSI Disk Mode feature exists on all PowerBook models except the PowerBook 140, 145, 145B, 150, and 170. Those PowerBook computers that DO support the feature have it coded into their read-only memory (ROM) on the logic board.

PowerBook Models Using HD Target Mode
When you are using a PowerBook 190 or 5300 series computer, this disk mode function is no longer called SCSI Disk Mode. It is called HD Target Mode because these PowerBook models have an integrated drive electronics (IDE) hard drive, not a SCSI hard drive. Although the terminology is different, the function is the same.

Which SCSI Cable?
You must use the appropriate SCSI cable for SCSI Disk Mode. The part number for the Apple HDI-30 Disk Adapter cable is M2539LL/A.

You can distinguish the Disk Adapter cable from a standard PowerBook SCSI cable by looking at the number of pins in the connector on the end of the cable that plugs into the PowerBook.

* The Apple HDI-30 Disk Adapter (M2539LL/A) cable's connector has 30 pins. It is the thirtieth pin that puts the computer into SCSI Disk or HD Target Mode.

* The Apple HDI-30 SCSI System (M2538LL/A) cable's connector has 29 pins. It is used to connect external SCSI devices, like CD-ROMs and hard drives, to your PowerBook computer.

What About PowerBook Duo Computers?
For the PowerBook 200 and 2300 Series (Duo) computers, you must use the Apple HDI-30 Disk Adapter cable in addition to the Duo MiniDock to enable the Duo to be used in SCSI Disk Mode.

NOTE The Duo Dock, Duo Dock II, and Duo Dock Plus do not support SCSI Disk Mode. When a PowerBook Duo computer is docked (except for the MiniDock) its SCSI capabilities are the same as any other desktop Macintosh computer, none of which support any kind of SCSI Disk or Target mode function.

PowerBook: International Travel & Overseas Purchase

What are the legal requirements for travelling with PowerBook computers internationally? What do you advise to avoid damaging the unit and/or voiding the warranty?

What government regulations do I need to be aware of for units purchased overseas (in particular Europe and the Far East), and brought into the U.S.?
This article has been archived and is no longer updated by Apple.
There are export restrictions on PowerBook computers. You should contact the local U.S. Customs Department to find out what paperwork you'll need to export and import the equipment. If the value of the equipment is over $2500, you also need to contact the local Department of Commerce and obtain a Shipper's Invoice.

You should not check the unit with luggage. If you must check it, use the original box. To avoid damage while travelling, a well padded and durable case should be used to transport the PowerBook. Be sure the battery is charged to demonstrate that the unit is functional.

Apple has a global warranty so that products purchased in or out of the United States can be repaired at any Apple authorized service provider. Be aware that parts availability may be limited and as a consequence, repair times may be extended while out of the country of original purchase. Be sure to have your proof of purchase with you when travelling overseas to validate warranty coverage.

TA47488_PowerBook_Macintosh_Classic_II_No_Support_for_System__(TIL09140).pdf

PowerBook & Macintosh Classic II: No Support for System 6

Does system software version 6.0.7 work on the Macintosh Classic II and the Macintosh PowerBook? If not, why not?

This article has been archived and is no longer updated by Apple.
The Macintosh PowerBook models and the Macintosh Classic II DON'T SUPPORT system software version 6.0.7 or version 6.0.8.

The software may work on the Macintosh PowerBook 100, but the backlit screen support, battery DA, and Low Power Dialogs won't work. The PowerBook 140 and 170 don't support System 6.0.x due to the newer ROM and other modifications in those systems.

The Macintosh Classic II has a different processor, and applications may have problems due to the different processor. You may not be able to install or start up with version 6.0.7 or 6.0.8 on the Macintosh Classic II.

Apple Computer won't answer questions based on problems associated with
running system software versions 6.0.7 or 6.0.8 on any of these computers.

Macintosh Quadra 700 and 900: Answers to Common Qs (11/94)

This article answers common questions about the Quadra 700 and 900 computers.

This article has been archived and is no longer updated by Apple.

Q. Can the key position be sensed through software?
A. There is no way to detect the key position through software.

Q. Why didn't Apple use the IIfx RAM? Don't the latched writes speed up the CPU?
A. Apple didn't use the IIfx RAM on the Quadras because it wasn't necessary. The writes are "latched" on the 68040 itself, so we didn't need to do it externally. In other words, if the 68040 needs to do a read and a write at the same time, it will do the read first (since it needs to read data to continue). It saves the write data until the read is done, and then it will write.

Q. How can we get the physical Ethernet address of built-in Ethernet?
A. The Ethernet address is not available via system call.

Q. What is the speed of VRAM?
A. The minimum speed of the VRAM is 100ns, but Apple's upgrade package will be 80ns to assure future compatibility.

Q. Does Apple support 24-bit mode on the 21-inch Color Display? A. When we designed the frame buffer controller, the 256K VRAM SIMMs were the only SIMMs Apple was using (in the Display Card 8*24). The design goal was to use 4 banks of VRAM so that we could do "four-way-bank- interleaving." This is a method for getting the data out of the four banks in a staggered fashion, since no single bank could provide data fast enough to refresh most monitors at higher bit depths.

If we used larger densities of VRAM (that is, 512K), we still couldn't obtain 24-bit on the 21-inch display because the video driver chip (RAM-DAC aka AC/DC) could not support the clock speeds required to do 24-bits on a 21-inch monitor. This would require a much more expensive RAM-DAC. We would have to use 64-bit data paths in the frame buffer, which would have been prohibitively expensive for a main logic board solution.

Q. Does Apple's Display Card 8*24 support the 21-inch Color Display in 24-bit?
A. The Macintosh Display Card 8*24 doesn't support the 21-inch Color Display at 24-bit (2MB is not enough). The RasterOps 24-bit card provides a third-party solution.

Q. Is the 21-inch Color Display supported by the on-board video on the Macintosh IIci, IIsi, or LC?
A. The 21-inch Color Display isn't supported by the on-board video on the Macintosh IIci, IIsi or LC.

Q. Is the AppleCD SC drive supported internally by the Quadra?
A. The older AppleCD SC drive is not supported internally by the Quadra 900.

Q. What is a Pseudo Block transfer?
A. The term "Pseudo Block transfer" is really a 68040 term that indicates what type of system bus cycle we run when a Move16 instruction moves data to/from a NuBus board. Developers should use Move16 in their I/O drivers for higher throughput.

Q. Is the Symantec compiler compatible with the 68040 CPU?
A. Version 5.0 of the Symantec compiler is compatible with the 68040 CPU.

Q. Why isn't there 16-bit monitor support on the internal video as on the Macintosh LC?
A. We don't have 16-bit monitor support because the CLUT-DAC chip we use to generate the video control signals doesn't have a 16-bit mode. We couldn't use the CLUT-DAC chip from the LC because our video operates at higher frequencies (up to 100 MHz), which weren't supported by the LC CLUT-DAC.

Ethernet NB Card: Cables, Connections, Termination

This article contains the following questions and answers about the Ethernet NB Card, regarding termination and compatibility:

1) Regarding the Ethernet NB Card and thin coax cable, is the termination supplied by the Apple Ethernet Thin Coax Transceiver, or the Apple Ethernet 5/13-meter cable, or both?

2) Would the new self-terminating thin coax cable work if connected to the older EtherTalk NB card (various revs) with a T connector? If so, would a terminator on the T be necessary?

3) Regarding question 2, what if we wish to connect the old card to a new card/CPU with built-in AAUI port? How can the two different cards/ports be connected using the new thin or thick coax cabling/transceivers? Would they need to use standard coax cable or can they use the Apple cable?

Example: We want to connect a Macintosh IIfx with a Rev. M EtherTalk NB card to a Quadra 900, with built-in Ethernet. We now must connect the Rev. M card with a T connector to the AAUI thin coax transceiver on the Quadra 900. Are the cards compatible or is it the cabling?

4) Will the Synoptics concentrators support Apple Ethernet NB cards?

5) Will the current network configuration allow us to use the Apple LaserWriter IIg directly from the RJ-45 ports?
This article has been archived and is no longer updated by Apple.
1) Both the Apple Ethernet Thin Coax Transceiver and the Apple Ethernet 5/13-meter cables have the ability to supply termination. In regard to the Apple Ethernet Thin Coax Transceiver, there are two BNC connectors on the transceiver. If a cable isn't attached to one or both of these BNC connectors, termination is applied. When cables (any cables, Apple or non-Apple) are attached to both connectors, termination is not applied.

The Apple Ethernet 5-meter Thin Coax Cable and Apple Ethernet 13-meter Plenum Cable have terminators at each end of the cables. When nothing is attached at either end of the cable, termination is applied at the end of the cable where nothing is attached.

2) Yes, but the Apple Ethernet 5-meter Thin Coax Cable and Apple Ethernet 13-meter Plenum Cable are only self-terminating when an end is not connected to anything. If you are using an EtherTalk NB Card at the end of a network, the T connector will either need a terminator on the open end, or one of the self-terminating Apple cables attached with nothing connected at the other end of the cable.

3) There is no problem using non-Apple thin coax cable with the Apple Ethernet Thin Coax Transceiver, nor is there an issue using Apple Thin Coax Cable with the EtherTalk NB Card. The Apple Ethernet NB Card and AppleTalk NB Cards can be intermixed on a network with no issues.

4) Yes. The only caveat here is that the Synoptics concentrators must have a 10BaseT compatible card installed (Synoptics LatticeNet 3308 10Base-T Host Card, for example).

5) Yes, if the RJ-45 port is wired into a 10BaseT compatible host card (Synoptics LatticeNet 3308 10Base-T Host Card, for example).

Macintosh II: Problems With Limelight Projector

I'm having problems using a Limelight projector with a Macintosh II. The resolution isn't very good.
This article has been archived and is no longer updated by Apple.
There are two problems with connecting a Limelight to a Macintosh II video card:

1. The Macintosh II video card has a 15 pin DB-style female connector, whereas the Limelight has a BNC female input.

2. The Macintosh II video signals are 35KHz for horizontal frequency and 66.67Hz for vertical scan rate. To properly display the video signal, a bandwidth of 21 MHz for monochrome and 22MHz for color is needed. The Limelight projector has a bandwidth of 20Mhz and a horizontal auto lock maximum frequency of 33Khz

The first problem can be fixed with a specially configured cable. We wired a Macintosh video cable to split the green signal on pin 5 to a BNC connector. This cable allowed connection of both the monitor and the projector. Another solution would be to contact Arizona Covid or Extron Electronics. These companies manufacture break-out cables and converter boxes. In this case, it would merely be a cable change. Although some enhancements (vertical and horizontal picture centering or color enhancement) are included in their converter boxes, this is not particularly useful on a monochrome projector like the Limelight. Since screen position controls are also supplied on the projector, a converter will probably not be needed.

The second problem is not as easily dealt with without modifications to the projector. Since its circuitry can not accept higher frequency data rates, there is some image loss. Also, the plastic lens of the projector can't focus all parts of the screen clearly, resulting in a good deal of blurring on the edges. (A curved-back screen helps somewhat.) Though the Limelight specification claims a maximum of 33 KHz for the horizontal scan rate, the projector we tested was able to handle a full line of video from the Macintosh at 35KHz. This may be a specification set below the performance level on the projector -- however, the Macintosh scan frequencies were pushing the limits of the projector: it took very little adjustment to the horizontal control to lose the signal. A black box is not likely to sharpen the image by modifying the signals, since the problems are inherent in the projector's ability to handle the resolution. As it stands, with a break-out cable the projector does display the Macintosh II video, though the image may be objectionable to some.

TA47495_Macintosh_Classic_USJapan_Systems_Are_V_Only__(TIL09150).pdf

Macintosh Classic: US/Japan Systems Are 110V Only 10/91

I have a Macintosh Classic, and on the Power/Sweep-Board (805-0948-A) is a jumper that says 110/220 Volts. Is it simple to change to 220 Volts, 50 Hz for International use?

This article has been archived and is no longer updated by Apple.
The power supply for the US/Japan Macintosh Classic is 110V only. It cannot be switched to 220V. The power supply for the International Macintosh Classic is 220V only. There are different components installed on each power supply.

Modifying the power supply by changing the JP1 jumper to work within a different voltage is definitely not recommended and will void the warranty.

Apple Ethernet NB Card: 16-bit Bus Path and Tasks

I'm a developer with two questions about the Apple Ethernet NB card.

1) How many data bits does the card work with internally: 8, 16 or 32?

2) What is the use of the 68000 processor when using EtherTalk or MacTCP? Does any of that code run on A/ROSE and does it make the data transfer faster?

This article has been archived and is no longer updated by Apple.

1) The Apple Ethernet NB card has a 16-bit bus, and is comparable in performance to the older EtherTalk NB card.

2) Very few tasks are downloaded to the card (nothing on top of A/ROSE). So the on board 68010 mostly manages the DMA, off-loading little of the cycles and work required of the Macintosh's main logic board processor.

Incidentally, the SONIC chip used in the Ethernet NB card is 32-bit capable, and when used in Quadra systems is in 32-bit mode.

A/UX: Disabling AppleTalk for Serial ImageWriter Connection

Article Change History

08/31/92 - REVIEWED
* For technical accuracy.

We want to use a serial ImageWriter under A/UX. We don't have any network printer, and want to connect it on the printer port. To enable this, we reconfigured our kernel (newconfig noappletalk) to remove the AppleTalk connection on the printer port and then restarted to make this change effective.

After restarting, we opened the Chooser DA, and noticed that AppleTalk was still active. We selected the ImageWriter icon, and got the choice between Printer and Modem ports in the right window. As we selected Printer, we got a dialog box saying that AppleTalk will be disconnected. We chose OK and got the usual window reminding us to change the page setup. However, when this dialog box closed, the selected port was still Modem and not Printer.

Fortunately, we can still use the Modem port, even without disabling AppleTalk. Is there a way to disable AppleTalk on the printer port?

This article has been archived and is no longer updated by Apple.
Yes, you can disable AppleTalk on either the Printer port or the Modem port by doing:

appletalk -d

ONLY the Modem port can be used as the Chooser style of printing method from the MultiFinder environment. The Printer port DOESN'T work in A/UX 2.0.1. This applies to both direct serial line and direct LocalTalk line connection.

A/UX: Printing Large Files with "lpr" (9/94)

Is there a way to print files that are greater than 1MB using "lpr"? The manual entry says that "If you try to spool too large a file, it will be truncated."

After printing approximately 200 or so pages of a 400-page report, the file is truncated. This works out to about a 1MB limit on lpr. Do you have any suggestions on how we can run the whole file through the printer?

This article has been archived and is no longer updated by Apple.
The default maximum file size printed via Berkeley "lpr" printer spooler under A/UX is 1000 blocks (1K/block) which is about 1MB.

However, this default limitation can be changed via the printcap entry called "mx" specified in the /etc/printcap database file. You may use the 0 value for the unlimited file size printing (for example, mx#0). Refer to the man pages for further details.

EtherTalk: Ethernet Connectivity for the Macintosh II

This is an article about EtherNet for the Macintosh.
This article has been archived and is no longer updated by Apple.

Overview

EtherTalk demonstrates that AppleTalk is a network architecture independent of media type. EtherTalk increases AppleTalk's bandwidth significantly by using Ethernet, an industry standard medium. It also provides increased throughput for transmission-intensive applications while implementing the layered features and functionality of the AppleTalk architecture.

Installation

The EtherTalk card is easy to install and use. You don't need to worry about the Ethernet Link Access Protocol address assignments. Each EtherTalk card has a unique address, assigned at the factory and stored on the card. The driver automatically looks for and uses this address on an Ethernet network. (The network address is also printed on a label on the back of the board.)

Features

EtherTalk Macintosh OS software redirects AppleTalk packets from the printer port to the EtherTalk card. These packets are then encapsulated in Ethernet Link Access Protocol and then sent out onto the network. EtherTalk operates at speeds up to 10MBPS. The card can be configured for use on 'thick' or 'thin' Ethernet networks. (See the EtherTalk Interface Card manual for configuration details.)

You can connect a LocalTalk node to the printer port with one or more EtherTalk cards installed, and switch between the printer port or any one of the EtherTalk cards. Only one AppleTalk path can be active at any one time, and the 'network' function in the control panel is used to select the active network. (See Chapter 2 of the EtherTalk User's Guide.) There is a limit of 254 active EtherTalk users (including bridges) on any one Ethernet.

Performance

EtherTalk improves AppleTalk throughput, depending on the level of 'foreign' Ethernet traffic and total available bandwidth. A practical expectation is an improvement of 1.3 to 3 times over LocalTalk connections, with a total capacity of 3 to 5 times that of LocalTalk networks.

Bridges

An EtherTalk Macintosh II can't act as a bridge between a LocalTalk network and Ethernet. It's possible to write bridging software, but none is included with the EtherTalk product.

AppleTalk Protocol Notes

EtherTalk under Macintosh OS implements AppleTalk according to Inside AppleTalk specification with some enhancements to allow operation on Ethernet networks. This means that Ethernet devices that don't implement these protocols and enhancements will be unable to 'see' the card on an Ethernet network. This is applicable only under Macintosh OS using AppleTalk protocol.

Under Macintosh OS, a special driver (.ENET) is utilized to 'push' packets onto the network. This driver is similar to the LocalTalk driver.

Packets sent by this driver in AppleTalk mode are restricted to 768 bytes to allow encapsulation by an Ethernet LAP.

These packets will co-exist with TCP/IP, XNS or other Ethernet protocols on the same network without problem.

A/UX: Maximum Address Space per Process (8/94)

I'm running A/UX on a Macintosh IIfx with 32MB of RAM. When running a test program, it appeared that one process can allocate a maximum of 28MB, although several processes together can allocate the maximum available virtual memory (32MB swap + 13MB internal memory available). Is there a way to increase the limit of 28MB?

This article has been archived and is no longer updated by Apple.
We aren't sure how the "test program" came out with a maximum of 28MB address space allocated to one process. What kind of method did the tested program allocate for memory, via sbrk(), malloc(), calloc() or other system calls?

The maximum user address space for process is by default 40,000 pages, which is about 1GB. The kernel parameter for the maximum user address space is MAXUMEM, shown via "kconfig -av." Although it can be up to 1GB, it still depends on how much swap space and physical memory is currently available. One way to increase to the address space limit for a process is to increase swap space (swap -a)!

Note that the MINASMEM (the minimum number of 10 pages reserved for the system to avoid deadlock) must be taken into consideration when calculating the current available swap disk space and resident memory.

A/UX: Printing Garbage When Starting A/UX (9/94)

I am running A/UX 3.0 on a Macintosh IIfx with 32MB of RAM. We have serially connected a line printer, using the "lp" system. The printer works, but when we start A/UX, the computer sends a lot of garbage to the printer. This continues until we turn off the printer. What causes this, and how can we avoid it?

This article has been archived and is no longer updated by Apple.
Perhaps you had AppleTalk/LocalTalk printing configured before, and used either the modem (tty0) or print (tty1) port. Also, some unfinished print jobs left in the spooler might print out this way. Go to the /usr/spool/lp directory and check for anything left in the print queue.

Here are some other things you might want to check:

- Is the printer port (tty0 or tty1) getty disabled in the /etc/inittab file?

- Use the "ps -ef" command to display all processes that might introduce the problem.

- Is the 'lp' or 'lpd' daemon functioning properly?

TA47505_AUX_cant_create_lower_memory_segment_Error__(TIL09162).pdf

A/UX: "can‘t create lower memory segment" Error (9/94)

After starting the A/UX system and the Login process, the Finder emulation starts, but the Command Shell doesn't. Meanwhile a message appears somewhere on the screen saying: "can't create lower memory segment". This is an intermittent error that appears three or four times a day.

This article has been archived and is no longer updated by Apple.
The "can't create lower memory segment" error message might be displayed because the system has temporarily exhausted its available physical memory or swap space, or the number of shared memory segments attached to the calling process exceeds the system-imposed limit. This usually happens while trying to start up the Macintosh environment executed by the "startmac" process. Check your available memory and swap space to see if this is the case.

Macintosh: Don‘t Have More Than One System Folder per Disk

This article has been archived and is no longer updated by Apple.

In spite of what you may have read -- for example, on page 24 of the Macintosh Hard Disk 20 manual -- a given disk, be it a floppy, HD 20 or SCSI drive, should contain one and only one System folder.

Published Date: Feb 18, 2012

TA47510_ILink_Controls_Apple_IIc_Bus_Components_from_a_Macintosh_(TIL09170).pdf

I0Link Controls Apple IIc Bus Components from a Macintosh

A new product, called IOLink, that controls Apple IIc bus components from a Macintosh computer is now available from Hamlin Technical. Apple IIc is a serial bus standard developed by Philips/Signetics that allows all circuits within a system to communicate bidirectionally with each other. Apple IIc compatible components are available from a number of manufacturers.

This article has been archived and is no longer updated by Apple.
IOLink offers engineers and technicians a way to control all sorts of circuits on the workbench; for example, analog input and output, parallel I/O ports, high-current solenoid drivers, video and audio circuits. IOLink runs on any Macintosh and consists of a hardware interface and either a stand-alone application or HyperCard XCMD.

The IOLink products are a solution in almost any moderate speed I/O application for the Macintosh where plug-in cards or RS-422 controllers were used. Apple IIc bus developers can test and debug their products from either the IOLink application program or HyperCard.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

Personal LaserWriter: Why No Page Counter

Is there any way to find out how many sides of paper a Personal LaserWriter SC has printed in its lifetime?

This article has been archived and is no longer updated by Apple.

There is nothing built into the Personal LaserWriter engine that counts printed pages. A mechanical counter would add cost and be vulnerable to tampering. An electronic counter would require additional logic that may not otherwise be present.

About the only laser printers with a page counter are those with a built-in PostScript interpreter. Implementing one on a PostScript controller is relatively trivial, because the requisite logic is already in place. The count is usually used to determine mechanism wear.

Published Date: Feb 18, 2012

LaserWriter: Thinnest Possible Lines

What is the minimum line width that a Personal LaserWriter NT can print (in millimeters and points)? Is this the same for all LaserWriter printers?

This article has been archived and is no longer updated by Apple.
The thinnest line a LaserWriter can print is limited by what's known as a device pixel. With all LaserWriter models to date, including the Personal LaserWriter (using the Canon P-110 engine), a device pixel is 1/300 of an inch, or .08mm. This translates to 24/100, or roughly one quarter of a point.

Many programs won't actually display a line this narrow, and instead use one point as their smallest printable unit. This PostScript code will generate an example page with a matrix of lines, each a single device pixel thick:

```
0 setlinewidth
72 72 612 {dup 0 moveto 792 lineto stroke} for
72 72 792 {dup 0 exch moveto 612 exch lineto stroke} for
showpage
```

Use a PostScript dump utility to download this program. This feature is available in version 7 of the LaserWriter Font Utility, or one of the old standbys like PSDump or Widgets.

DAL: TCP/IP Support for VAX, IBM, and UNIX Hosts

I'm using System 7 on a Macintosh II-class computer. I have some DAL questions:

1) Does DAL for VMS, or DAL for MVS, support TCP/IP from the workstation? In other words, can I log on to a VAX or IBM host from a Macintosh using Data Access Language and TCP/IP protocol?

2) Do any of the front-end DAL products (ClearAccess, Brio, GQL) support TCP/IP protocol for doing the DAL/SQL queries?

3) Any idea who might have a DAL for UNIX product?

This article has been archived and is no longer updated by Apple.

1) Neither DAL for VMS nor DAL for MVS support TCP/IP connections. The only DAL servers that support TCP/IP connections are DAL Server for VM and DAL Server for A/UX.

With DAL 1.3, you can log on to a VAX using the following DAL connections:

- ADSP
- ADSP toll (with Comm Toolbox tool)
- Asynchronous
- Async CTB (with Comm Toolbox tool)

With DAL 1.3, you can log on to an IBM MVS host using the following connections:

- MacDFT Coax/Twinax card connection
- MacDFT TokenTalk NB Card connection - not in System 7
- MacDFT Serial NB Card connection - not in System 7
- MacIrma connection
- MacIrma HLLAPI connection
- MacMainFrame connection
- NetWay 1000/2000 connection
- Protocol Converter connection
- SNA*ps APPC connection - as of release 1.3.5 of FAL, SNA*ps 3270
- connection.

2) If DAL Server and Client support the connections between the client workstation and the host, the applications will work without any changes.

3) APDA offers a product for DAL support for TCP/IP connections to VM and to develop for UNIX hosts. Pacer software licenced DAL to develop for UNIX hosts, and are now shipping some UNIX DAL servers. For more information, please contact Pacer directly.

PATHWORKS: Using With Wollongong‘s TCP/IP

We would like to run PATHWORKS on our VAX systems. However, we are entirely based on TCP/IP and don't run DECnet at all. We are using TCP Connect II on Macintosh computers.

The other difficulty is that we don't use DEC's TCP/IP, but rather, Wollongong's TCP/IP.

Will this work?
This article has been archived and is no longer updated by Apple.
PATHWORKS for Macintosh is a Digital product. It is sold and supported by Digital. The official line from Digital is that they only support their version of TCP/IP.

You won't be able to get all the components to work if you don't allow DECnet protocols, since most of them rely on DECnet. The most common thing people use TCP/IP for is MacX and DECwindows; if you use another package, you need to make some adjustments for this to work. For instance, you will have to log on to the VAX via Telenet, and under VMS, create a display for DECwindows with the $ SET DISPLAY command. You will have to know what parameter to specify for /TRANSPORT because the keyword TCPIP is reserved for the Digital TCP package. After you successfully create the display, you may use the $ SPAWN or $ RUN/DETACH command to execute the DECwindows client over the display.

The bottom line is that you will have to work with both Digital and Wollongong to get the correct syntax for different operations. If you are very interested in running PATHWORKS in this environment, we suggest you discuss the situation with the Digital Account Rep for an official Digital solution.

PATHWORKS: Printing Option-Key Characters (11/94)

When printing any letter or character produced by an option-key combination, like the * (Option-8) character, the result is garbage -- regardless of the font/software package used on the Macintosh. I think the eighth bit is being dropped from the datastream somewhere between the Macintosh and the printer.

Here is the configuration:

- DEC VAX running PATHWORKS 1.0 and GrayMatter Print Spooling Software
- Macintosh Workstations running System 7
- QMS PS-810 Laser Printers
- MMac/8 Serial-to-Ethernet Cable Routers connecting the QMS serially to the router, then Ethernet from the router to the VAX.

This article has been archived and is no longer updated by Apple.
We printed a MacWrite document, with a number of Option-key-combination characters, to an Apple LaserWriter via the PATHWORKS 1.0 VAXshare Print Services with no problem.

We aren't really clear how GrayMatter Print Spooling Software fits into this picture, because PATHWORKS for Macintosh comes with the VAXshare Print Service. It would be helpful to know if you're printing from a Macintosh to the VAXshare Print Spooler or from the GrayMatter Print Spooler.

At any rate, the official statement from Digital for PATHWORKS 1.0 is that it only supports the following Digital and Apple printers:

- Digital: LPS20, LPS40, LPS40 Plus, LN03R
- Apple: LaserWriter, LaserWriter Plus, LaserWriter IINT and IINTX

Serially connected printers might have a problem with the default settings of 7-bit mode. To print the Option-key-combination characters, you'll need to set it to 8-bit mode.

To set the printer to 8-bit mode, print the following two files:

msap$set_params.ps
msap$show_params.ps

in the PATHWORKS directory: msa$root:[msa.msap$utility]

The second file prints a confirmation sheet on the printer.

If the above suggestion doesn't work, we strongly suggest that you contact the Digital Customer Support Center. They might know of problems associated with third-party printers and PATHWORKS, and might already have a patch for it in their database.

AppleShare 3.0: Memory and Apple II Limits

1) To run under System 7, AppleShare 3.0 needs 4MB RAM. Does this include having the Print Serving option running as well?

2) Is 5MB enough to run AppleShare File Server 3.0, AppleShare Print Server 3.0, AppleTalk Internet Router and support for Apple II users?"

3) I saw something on a limitation of 20 some Apple II users -- is this a simultaneous log-on limit, or can I assign only 20 users the ability to log on from an Apple II?

This article has been archived and is no longer updated by Apple.

1) The 4MB requirement for AppleShare 3.0 includes concurrent operation of both file and print services. This includes Apple II access.

2) On a 5MB Macintosh IIci system you would also be able to install the Apple Internet Router, although for performance considerations it would be better to have the Apple Internet Router reside on a dedicated Macintosh. High traffic involving one of the applications can severely impact the performance of the other.

3) Although it is possible to define up to 8,192 users/groups (including the ability to log on from an Apple II), we would recommend not more than 2,000 users/groups. As the number of users/groups grows beyond 2000 and approaches 8000, it can take significantly longer to start up because it takes longer for AppleShare 3.0 to read through so many names. It doesn't affect server running performance or the amount of RAM required. The limitations regarding the number of users, Macintosh and Apple II alike, that can sign on concurrently is defined in the AppleShare 3.0 File Server Preferences. AppleShare 3.0 can accommodate up to 120 connections at one time.

If you plan to have Apple IIGS systems start up over the network, experience has shown that the length of time it takes to have more than 20 Apple IIGS systems do so may exceed the customers expectations. This will not be a problem if the Apple II systems are starting locally and then logging on to the file server.

AppleTalk Remote Access: Hayes SmartModem 9600, Custom CCL Tools

AppleTalk Remote Access doesn't ship with a setup for the Hayes SmartModem 9600. (If you use the standard 9600 with the Ultra CCL, it connects only at 2400, not 9600.) Where can we get a tool to create CCLs for other types of modems for use with AppleTalk Remote Access?
This article has been archived and is no longer updated by Apple.

SmartModem 9600

The Hayes V-Series SmartModem 9600 (also known as the Express 96) uses Advanced Hayes Proprietary 9600 Communications. Due to the nonstandard and proprietary nature of the modems (they are not V.32 compatible), Apple decided not to include a CCL for them.

An Express 96 can only communicate at 9600 baud with another Express 96. As you discovered, use of the "Hayes Ultra 96" CCL limits communications to 2400 baud between Express 96 modems. A "CCL.Hayes V9600" CCL has been developed internally for use with the Express 96.

Tool for Custom CCLs

The Modem Workshop HyperCard stack used to develop AppleTalk Remote Access CCLs is available for customers through APDA.

00-02	START	Initialize low RAM memory
03-05	RDYJSR	Jumps to STROUT
06,07	ADRAYI	Address of AYINT subroutine
08,09	ADRGAY	Address of GIVAYF subroutine
0A-0C	USRPOK	Vector for USR() function
0D	CHARAC	String delimiter
0E	ENDCHR	String delimiter
0F	COUNT	General purpose counter
10	DIMFLG	Flag to permit arrays
11	VALTYP	Variable type indicator. 0=numeric, 1=string
12	INTFLG	Variable type indicator. 1=integer, 0=real
13	GARBFL	Flag to signal the need for garbage collection
14	SUBFLG	Flag to permit array variables.
15	INPFLG	Determines if this is INPUT or READ
16	TANSGN	Used for the sign during TAN() function
1A,1B	SHAPE	High-Res shape pointer
1C	HCOLOR1	High-Res running color mask
1D	COUNTH	High-Res counter
26,27	HBAS	High-Res base address pointer
2C	H2	
2D	V2	
45	ERROV	
50,51	LINNUM	16 bit integer work area
53,54	LASTPT	Pointer to last used string temporary
55-5D	TEMPST	Temporary string descriptor storage area
5E,5F	INDEX	General purpose index
60,61	INDEX2	General purpose index
62-66	RES	Multiply or divide result (HO,MOH,MO,LO)
67,68	TEXTAB	Pointer to start of the program text
69,6A	VARTAB	Pointer to start of simple variable space
6B,6C	ARYTAB	Pointer to start of array variable space
6D,6E	STREND	Pointer to end of storage in use
6F,70	FRETOP	Pointer to top of string free space
71,72	FRESPC	Pointer to new string
73,74	MEMSIZ	Pointer to top of memory
75,76	CURLIN	Current line number
77,78	OLDLIN	Old line number, set up by ctrl-C, STOP, or END
79,7A	OLDTXT	Old text pointer
7B,7C	DATLIN	Line number where data for next READ comes from
7D,7E	DATPTR	Pointer to data for next READ
7F,80	INPPTR	Pointer to where input is coming from
81,82	VARNAM	Storage area for a variable's name
83,84	VARPNT	Pointer to a variable in memory
85,86	FORPNT	Variable pointer for FOR and LET
87,88	OPPTR	Pointer to current formula operation in OPTAB
89	OPMASK	Mask created by current operator
8A,8B	DEFPNT	Pointer used in function definition

8C,8D	DSCPNT	Pointer to a string descriptor
8E	TEMPF3	Temporary pointer
8F	FOUR6	Constant for garbage collection
90-92	JMPER	Internal vector
93	TEMPF1	Temporary pointer
94,95	ARRYPT	Pointer into an array
94,95	HIGHDS	Destination of highest element in BLT.
96,97	HIGHTR	Source of highest element to move in BLT.
98	TEMPF2	
99,9A	LOWDS	Location of last byte transferred into in BLT.
9B,9C	LOWTR	Last thing to move in BLT. See BLTU.
9D-9F	DSCTMP	Temporary string descriptor
9D-A2	FAC	Floating point accumulator. (EXP,HO,MOH,MO,LO,SGN)
A3	SNGFLG	Sign of FAC. Set up by FIN.
A4	BITS	
A5-AA	ARG	Floating point argument (EXP,HO,MOH,MO,LO,SGN)
AB,AC	STRNG1	Pointer to a string or descriptor
AD,AE	FBUFPT	Pointer into FBUFFER for FOUT
AF,B0	PRGEND	Pointer to the end of the program text
B1-C8	CHRGET	Character fetcher
C9-CD	RNDX	Random number seed
D0,D1	DX	High-Res delta-X for shape and HLIN
D2	DY	High-Res delta-Y for shape and HLIN
D3	QDRNT	High-Res rotation quadrant
D4,D5	E	High-Res error for HLIN
D6	RNONLY	Run only flag
D8	ERRFLG	Flag set by ONERR GOTO
DA,DB	ERRLIN	The line number where the error occured
DC,DD	ERRPOS	Where in memory did the error occur
DE	ERRNUM	Which error occured
DF	ERRSTK	6502 stack pointer from REMSTK after an error
E0,E1	XO	High-Res prior X coordinate save
E2	YO	High-Res prior Y coordinate save
E4	HCOLOR	High-Res color byte for HPLOT, HPOSN
E5	HNDX	High-Res horizontal offset save
E6	HPAG	High-Res page ($20 = HGR1, $40 = HGR2)
E7	SCALE	High-Res scale for SHAPE
E8,E9	SHAPX	High-Res start of shape table
EA	COLLSN	High-Res collision counter
F0	FIRST	
F1	SPDBYT	Controls delay between printed characters
F2	TRFLAG	Controls TRACE mode.
F3	ORMASK	Controls masking for INVERSE on video output
F4-F7	ERRTO	Points to the GOTO part of ONERR statement
F8	REMSTK	6502 Stack pointer save area.
F9	ROTBYT	High-Res rotation factor for SHAPE
100-10F	FBUFFR	Buffer for FOUT
200-2F0	BUF	Input buffer

Macintosh Pascal 1.0: Putting comments into the code

This article has been archived and is no longer updated by Apple.
Multi-line comments with a single pair of brackets are not allowed in Macintosh Pascal; instead, you must frame each line of the comment with its own set of brackets.

To work around the problem of using large blocks of comments within MacPascal, break up large blocks of comments with a valid Pascal statement. A declaration, begin or end statement, etc. will do the job, and the program can then be loaded normally. You might also try severely limiting the number of consecutive comments on lines by themselves.

There are no plans to change this situation, documented in the new version of the MacPascal Technical Reference manual.

The problem is easily duplicated by creating a Pascal "program" that contains nothing but comments. The key is the number of characters contained in the comments: 20 lines of about 70 characters per line should be sufficient. As long as comments reside on lines following an actual Pascal statement, the problem goes away. But this is not really practical or practiced. This will be submitted to Software Testing for further evalution.

To create a Macintosh Pascal listing with any amount of comment information, cut and paste your code to another document; you can then add documentation to this listing as you please.

A/UX: How to Configure for EtherTalk Support (9/94)

How do I install the EtherTalk drivers under A/UX? Neither the EtherTalk Installer Disk nor the Network CDEV seems to work.

This article has been archived and is no longer updated by Apple.
Network protocols, like TCP/IP and AppleTalk, must be configured into the A/UX kernel before they can be used. When A/UX is shipped, TCP/IP is not part of the kernel. AppleTalk is installed but configured only for the LocalTalk port, not over an Ethernet card.

To add networking capability through the Ethernet port, you must add a low-level driver to the kernel. The EtherTalk drivers on the EtherTalk Installer disk install an Ethernet driver for the Macintosh Toolbox to use. Because, under A/UX, the Macintosh Toolbox environment relies on the A/UX kernel to take care of networking, installing a Macintosh Toolbox level driver is not enough.

To use either TCP/IP or EtherTalk protocols, add the Ethernet driver using the newconfig command. See the directions in the "Network System Administration" manual for a full description of configuring the kernel for Ethernet. The short version follows.

Before beginning, you must have the following:

- An IP address

- A broadcast address

- A netmask and a hostname.

Check with your network administrator if you aren't sure what these should be in your installation. These instructions assume an Apple Ethernet card. If your Ethernet card is from another vendor, you will need to get A/UX drivers for the card. The Macintosh OS drivers are not sufficient to establish Ethernet services (TCP/IP or AppleTalk) under A/UX. Follow the instructions from the vendor for how to install the A/UX drivers and configure the kernel.

1) Assuming you have an Apple card (or have properly configured your third-
party card), from the Command Shell, type the line:

newconfig bnet

2) If you also need nfs services, type:

newconfig nfs

The system will reconfigure itself to include the new modules. It will prompt you to answer several questions, including IP address, broadcast address, and so on. When it asks if you want this system to be a Yellow Pages client, say no.

--WARNING--¨If the system is configured to be a Yellow Pages client when there is no Yellow Pages server present on the network, or if the A/UX system can't talk to the YP server for any reason, the A/UX system will hang forever on the next boot. This is because it is trying to connect to a server that doesn't exist. It's much safer to say "no" to being a YP client now and turn on the YP daemon later, after the TCP/IP connections have been verified.

ImageWriter II: Faded Print Caused By Damaged Carrier Shaft

This article has been archived and is no longer updated by Apple.

If an ImageWriter II is dropped or handled roughly, the carrier shaft bushing may break, allowing the carriage to pull away from the platen on one side. Output looks fine on one side of the paper, but gradually fades out as it moves to the opposite side of the paper. Adjusting the paper thickness lever doesn't cure the problem.

The carrier shaft bushing may appear intact, but if you look closer, the two small dimples that the shims mount to are probably fractured or broken off. Replace the broken carrier shaft bushing (958-0006).

TA47559_AUX_Using_Claris_FileMaker_(TIL09230).pdf

A/UX: Using Claris FileMaker

Article Change History

08/31/92 - REVIEWED
o For technical accuracy.

FileMaker works great when I'm logged in as root, but if I log in as anyone else, it says it can't execute.

This article has been archived and is no longer updated by Apple.
Check the ownership and permissions of a directory called "Claris" in the global System Folder. Along with other Claris applications, FileMaker stores temporary files in a folder called "Claris" in the current System Folder.

If the folder doesn't exist, FileMaker creates it and starts putting temporary files there. However, new files and directories under A/UX are created with a default user mask. This mask sets the permissions on the file or directory to allow write permission only to the user who created the file or directory. As a result, the first account to use FileMaker would have a Claris folder created, but only that account could write to it. The solution is to change the permissions on the Claris folder to allow read and write access by everyone.

A/UX: Why Root Has More Space Available than Regular Users

Why do root and regular users have different amounts of space available on their file systems?

This article has been archived and is no longer updated by Apple.

A/UX follows the Berkeley file system. There's a default high-water mark of 10 percent of disk space that isn't available for use by non-privileged users, although you can adjust this with the tunefs command. Root, however, can do anything, including filling the file system to capacity.

Printing: Background Printing Is Normally Slower

Documents printed with non-TrueType screen fonts under background printing take several minutes per page on the Personal LaserWriter LS. Why?

This article has been archived and is no longer updated by Apple.

This is normal. The advantage of background printing is that it lets you work on a task while a document is printing. Printing in the background means that printing must share the processor with some other process instead of taking all the processing speed. Therefore, it is slower. What you see is normal.

A/UX: How to Protect the Macintosh Partition

Article Change History

08/31/92 - REVIEWED
o For technical accuracy.

How do I protect the Macintosh partition from being used or altered under A/UX?

This article has been archived and is no longer updated by Apple.
The regular UNIX file system protections won't work, because it's a Macintosh OS HFS file system. The only way to protect the Macintosh partition while A/UX is running is to have it not available in the first place. Build the A/UX disk without a Macintosh partition and launch A/UX from a floppy.

Published Date: Feb 18, 2012

A/UX: Syslog Doesn‘t Log su Attempts (8/94)

It looks like syslog does not record attempts to su nor failed login attempts. Syslog does record some events, but it won't record them to a remote host.

This article has been archived and is no longer updated by Apple.
Correct. Syslog belongs to Berkeley UNIX, and A/UX to System V. A/UX login, su, and other programs don't make the calls to syslog, so the messages can't be recorded. The manual page should be updated to reflect this fact. As it stands now, the syslogd man page says that login and su generate syslog messages; this is incorrect.

Logging messages to a remote system is broken, and an SPR has been filed.

A/UX: How to Create a Bootable Partition with HD SC Setup

A/UX 2.0 installation onto an Apple 160MB hard drive fails with a "no valid root partition" message. I used the "50% A/UX, 50% Macintosh OS" option within HD SC Setup.

This article has been archived and is no longer updated by Apple.
The "50% A/UX, 50% Macintosh OS" option creates a disk with half the space in a Macintosh volume and the other half set up for a random A/UX file system. These partitions are not suitable for a bootable A/UX system.

To reserve 80MB for the Macintosh operating system with the remaining space for A/UX, follow these steps:

1) Bring up HD SC Setup, and select the standard A/UX Partition option.

2) Click the Custom button to do custom partitions.

3) Select the Macintosh Partition and delete it.

4) Click and drag the existing A/UX partitions closer to one another to concentrate all the gray space (representing unallocated space on the disk) at the bottom.

5) Create a new Macintosh partition; click in the gray space, select Macintosh Volume as the partition type, and make the size equal to the maximum available.

6) Click "Done" and quit HD SC Setup.

TA47571_AUX_Using_Claris_MacWrite_II__(TIL09244).pdf

A/UX: Using Claris MacWrite II (9/94)

Printing from MacWrite II under A/UX doesn't work. Nothing comes out of the printer. Printing from lpr works as does printing from other Macintosh Toolbox applications.

This article has been archived and is no longer updated by Apple.
Like other Claris products, MacWrite II puts temporary files in a Claris folder located in the System Folder. This folder is created the first time a Claris product runs. If the user happens to be root at the time the application is run, the default user mask sets the privileges on the folder, so that only root has read and execute privileges on the folder.

Change the permissions on the folder to allow read, write, and execute privileges for everyone, and printing should work fine.

A/UX: How to Keep Users from Starting from a Floppy

Article Change History

08/31/92 - REVIEWED
* For technical accuracy.

Is there a way to prevent students and other users from starting their A/UX systems from a floppy?

This article has been archived and is no longer updated by Apple.
There's no way to achieve that level of security, given the way the Macintosh OS works on a normal Macintosh. Beyond locking up the physical computer, there is no way to prevent people from turning their systems off and restarting from a floppy.

One potential workaround would be to unplug the floppy-drive cable from the logic board. This wouldn't stop someone who knew what to look for, but it would get in the way of the less knowledgeable.

AppleShare 3.0: Upgrading Client Software Highly Recommended

I've recently installed AppleShare 3.0.

When I configured the server using Admin, I set up each user with NO password, and I also set the minimum length of each user's password to 4. Additionally, I checked the option that forces the users to change their passwords the next time they log on.

When I try to log on to the server from the IIx, I get a message that an unknown AppleShare error has occurred. It's not fatal -- I just can't log on. By adding a 4+ letter default password to each user, I can then log on.

Since I support an installed base of over 80 File servers and 6,000 Macintosh computers, I want to stress that whatever options we install with AppleShare 3.0, they must work with 2.01 client software. It's unlikely that most of the installed base will migrate to 3.0 client software.

Configuration:

- Server: Macintosh SE/30 4/80 with System 7.0 and AppleShare 3.0 (all product options) installed.

- Client: Macintosh IIx 5/40 with System 7.0 and AppleShare 2.01 client code.

This article has been archived and is no longer updated by Apple.

The source of your problem is exactly what you are trying to avoid. Without the AppleShare 3.0 client software installed, the client software doesn't understand the messages the server sends to it. For example, using an all AppleShare 3.0 setup, if you need to change your password, you will get the dialog that allows you to change your password. If you have old client software, then you will only get an unsuccessful log-on message. The ability to log on without getting help from an administrator is more than a minimal benefit.

If an administrator is going to take advantage of AppleShare 3.0's extended security features such as minimum password length, or change password at the next log on time, then we highly recommend that you install the client software. You can install it over the network, without restarting, and it won't cause any disruption in the users' operation.

A/UX 2.0: Toolbox Shows Only 16MB RAM in About the Finder Window

I have 20MB of physical RAM installed, but "About the Finder" shows only 16MB. (True in 2.0 and 2.0.1)

This article has been archived and is no longer updated by Apple.

```
The A/UX Toolbox environment has a 16MB limit when you look at the About
the Finder window.  A/UX itself is using the full 20MB.
```

System Software 7.0.1: Support for PowerBook

This article describes the features of system software version 7.0.1 that support the Macintosh PowerBook computers.

This article has been archived and is no longer updated by Apple.

Caps Lock Extension

The Caps Lock key doesn't stay mechanically pressed down on the PowerBook computers. Caps Lock is an extension that adds an international caps lock symbol as a caps lock indicator to the menu bar. The symbol may not appear the instant the Caps Lock key is pressed, because the processor may have other tasks to handle before the Caps Lock extension is executed. Even though the menu-bar symbol may not change immediately, the keyboard does toggle immediately whenever you press the Caps Lock key.

Revised Low Power Dialogs

There are fewer low power dialogs. A lower voltage level prompts the dialogs to increase battery life and eliminate any memory effect on the NiCad battery. The last dialog box (10 second warning) comes up when the battery voltage is low enough to eliminate the memory effect. There are three dialog boxes that come up. The first dialog appears when about 15 minutes of life remains. The backlight dims to reduce power consumption. This is the time to save documents and plug in the power adapter. If operation continues, a second low-power message is displayed. At this point, you may have just enough time to save your documents. Finally, a 10 second dialog appears and the unit sleeps. If you plug in the power adapter within the next two days, all documents are saved.

New Portable Control Panel

The Portable Control Panel modification eliminates the brightness/contrast controls for the Macintosh PowerBooks. The Macintosh Portable gets this information from the Brightness Control Panel. This panel still selects the time until hard disk drive and system sleep. It also allows selection of internal or external modems on the Macintosh PowerBooks 140, 145, and 170 and the original Macintosh Portable. The PowerBook 100 doesn't have this option because it has no external modem port.

When clicking the "Minutes Until Automatic Sleep" text while holding down the Option key, the system rest dialog box appears. This causes a dialog to appear that allows turning the rest feature on or off.

Battery Control Panel

This controls a number of options and provides a visual indicator of the
charging status of the battery. You click the flag to see a number of options, depending on which PowerBook model you have. A sleep button comes up on all the portables (the Macintosh Portable and all PowerBook models). Power-Saver buttons come up on the Macintosh PowerBook 170. Power-Saver changes the processor speed to 16MHz on the PowerBook 170 to increase battery life.

Article Change History

09/24/92 - Corrected to show that there are three low-power messages, not two.
08/03/92 - Updated for PowerBook 145.

TA47605_System_Software_Support_for_Quadra__(TIL09294).pdf

System Software 7.0.1: Support for Quadra 700, 900, 950

Article Change History

09/24/92 - UPDATED
* To include Quadra 950.

This article describes the features of system software version 7.0.1 that specifically support the Quadra 700, 900 and, 950.

This article has been archived and is no longer updated by Apple.

Virtual Memory

The MMU table format changed in the 68040 CPU. The 68040 copy-back cache mode requires microprocessor-specific modifications to virtual memory. The ROM supports page write protection that prevents modification of RAM pages to ensure data integrity of those pages. The RAM disk feature of the Memory control panel uses this feature.

Network Control Panel

The Network control panel allows switching between physical networks such as built-in LocalTalk and Ethernet. The Quadra 700, 900, and 950 required modifications to the Network control panel to select the internal Ethernet connection.

Keylock Support

The keylock switch support disables all ADB activity, including power on in the secure position. The software programs the clock/ADB chip which controls ADB functions.

Published Date: Feb 18, 2012

System Software Version 7.0.1: New Features

Article Change History

09/24/92 - REVIEWED
* For technical accuracy.

This article lists the new features of Macintosh system software, version 7.0.1.

This article has been archived and is no longer updated by Apple.
System software version 7.0.1 supports the following new or revised features:

- Installer Script and CPU name support

- Memory control panel revisions

- Additional shutdown dialogs

- Revised Sound Manager

- Enhanced SANE routines

- Revised Brightness Control Panel

- Revised Network Control Panel to support on-board Ethernet

- Caps Lock indicator

- Revised low-power dialog messages

- Revised Portable control panel

- SCSI Disk Mode

- Battery DA modification

Memory Control Panel

The Memory Control Panel now supports a RAM disk on the Macintosh Portable, the PowerBooks, and the Quadra 700, 900, and 950. The RAM disk can only be used if the system has at least 3MB of memory.

Revised Shutdown Warning

A shutdown warning dialog appears on the PowerBook 140 and 170 and the Quadra 700 and 900 saying that you will lose all data in the RAM disk if you continue the shutdown. The dialog doesn't appear if there is no RAM disk, or if there are no files on the RAM disk.

NOTE: RAM disks on the Macintosh Portable and PowerBook 100 don't go away when the system is shut down. The warning is not needed on those computers.

Sound Manager Updates

The Sound Manager now supports the sound chips in the computers listed here. These computers use different sound chips, and the Sound Manager responds differently for each system.

Computer Sound Input Sound Output

PowerBook 100	No	Mono
Macintosh Classic II	Yes	Mono
PowerBook 140	Yes	Stereo
PowerBook 170	Yes	Stereo
Quadra 700	Yes	Stereo
Quadra 900	Yes	Stereo

Enhanced SANE Routines

A significant System file change provides a new SANE package for the Macintosh IIsi (when FPU is installed), IIfx, IIci, PowerBook 140 and 170, and Quadra 700 and 900. The SANE changes the trap call to a JSR that points directly to the SANE code in the system heap, bypassing the trap dispatcher. This increases the performance up to two and one-half times for integer and 5 to 6 times for floating point.

Brightness/Contrast Control Panel

The Brightness control panel modification supports the Macintosh Classic II. This driver is used with the Macintosh Classic, Macintosh Classic II, and the original and backlit Macintosh Portables.

This control panel doesn't work with the PowerBook computers. The PowerBook software reads from the slider controls and adjusts the screen brightness based on those values. The Power Manager handles the screen update and checks the sliders.

Backlight Driver

The Backlight driver supports the PowerBook computers and the Macintosh Classic II. This driver gets data from the Brightness control panel for the Macintosh Portable and the Macintosh Classic II, and from the slider or knobs on the PowerBook computers.

PowerBook: Sound Circuitry Power Conservation (8/93)

My PowerBook 140 emits a click from the speaker from time to time. Is this common, or is my unit defective?

This article has been archived and is no longer updated by Apple.
The system software detects if the sound chip is being used. If it hasn't been used for a while, power is disconnected from the sound circuitry in order to conserve power. During this shutdown process, a click may be heard from the speaker.

This power saving mode mostly affects the PowerBook 100, 140, 145, and 170. On more recent PowerBook models, it is possible to disable sound entirely by moving the volume to zero in the Sound control panel. Once the volume is set at zero on those models, even the startup sound will not chime. There will be no clicks from the speaker with the volume set to zero since the power to the sound circuitry is always off.

Article Change History:
16 August 1993 - Revised article with information about recent models.

PowerBook: Screen Power Consumption and Battery Life (7/92)

Does the use of white pixels draw more power than the use of black pixels on the PowerBooks (supertwist and active matrix)?

We're comparing the PowerBook 100 to several PC-compatible notebooks, and found that the PowerBook 100 doesn't have quite the battery life of some PC-compatibles. We're wondering about the screen's power consumption. We have some information on the PC-compatibles that says using the screens in inverse mode (black text on a white background) uses more power than their normal mode (white text on a black background). Is it worth setting the desktop pattern to all black or not?

This article has been archived and is no longer updated by Apple.

Screen Power Consumption

The black screen and the white screen draw almost the same amount of power: the black slightly less than the white (approximately 300 mW versus 320 mW).

The real power draw is the backlight (approximately 2.5 watts). The backlight at maximum is the largest power consumer of the entire system. Because most customers really use the light at maximum, Apple quotes battery life with the light on full brightness. We can't speak for how other manufacturers quote their battery life. However, the black versus white background argument is not valid in discussing battery life.

Battery Size Versus Weight

Not all batteries are exactly the same, but Apple uses a state-of-the-art NiCad battery. In this class of battery, capacity and weight are directly related. Competitors with higher system weight may have larger batteries, and therefore, longer battery life.

Truth in Testing

Apple tries to provide a real battery life description. We hear many reports of portable computers not meeting their reported battery life. Sometimes we suspect the testing procedure. Additionally, every manufacturer tests with a fully charged battery. NiCad charging is somewhat tricky; therefore, consumer reports of less than expected battery life need to be interpreted as a function of the NiCad charging sequence, battery history, and other factors. Apple uses an intelligent charging system to provide the best recharging possible.

PowerBook 100: When It Won‘t Recognize Third-Party Drive (8/92)

My PowerBook 100 won't recognize non-Apple hard drives.

This article has been archived and is no longer updated by Apple.
Are you using one terminator in the chain? This means either an external terminator or a built-in terminator to the third-party device.

The termination on the PowerBook 100 hard disk drive isn't strong enough to support the bus. So if the third-party device doesn't have an internal terminator, you need to provide an external terminator.

PowerBook: How to Clean the Trackball

My PowerBook's trackball doesn't work smoothly; it appears to "stick" or "jump" when rolled.
This article has been archived and is no longer updated by Apple.
Most PowerBook trackball problems are due to contamination of the rollers. The trackball is just like the standard Apple mouse in that dust and debris can accumulate on the rollers and impede smooth movement of the trackball.

Symptoms of a Dirty Trackball

Symptoms that your trackball is dirty are:

- The trackball appears to stick or jump when rolled.
- The cursor will not track horizontally or vertically.
- It sometimes seems like the cursor is hitting a wall.
- On-screen buttons fail to activate when you click on them.
- The movement of the cursor on the screen isnt smooth.
- The trackball is physically difficult to roll.

How to Clean the Trackball

1) Remove the trackball retaining ring by turning it counterclockwise until it pops out (about 1/4 turn). You dont need tools for this; you can just press against the two small ridges on the ring with your fingernails.

2) Lift the retaining ring and trackball out of its cavity.

3) Locate the small rubber rollers at the left and bottom sides of the trackball cavity. Depending on your model, they may look like small rings or wheels.

4) Use any reasonably clean, blunt object (such as your finger or a cotton swab) to wipe off the rollers. Do not use any liquid, including any amount of cleaning fluid or water, inside the computer.

5) Locate the three white or red bearings located at approximately clockwise 4:00, 7:00, and 11:00 in all PowerBooks except the PowerBook 100, which has three black posts instead of bearings. Using a fingertip, dry cotton swab, or other blunt object, clean them of any debris.

6) Replace the trackball and the retaining ring.

In addition, on a PowerBook 140 or 170, reseating the cables on the trackball and keyboard may solve the problem. This is very effective if the failure is related to the computer heating up. These cables are located inside the PowerBook, so your authorized service provider or Apple must do this.

iMovie 3: Preview Button Does Not Preview Effect or Title

On some configurations, clicking the Preview button in iMovie 3 may not display a preview of the title or effect in the larger playback window.
This article has been archived and is no longer updated by Apple.

Symptom

After selecting an effect or title in iMovie 3, clicking the Preview button does not render the preview in the large playback window as expected.

Solution

Update to iMovie 3.0.3 or later. It is available from the iMovie website (http://www.apple.com/imovie).
Published Date: Feb 18, 2012

Final Cut Express: French Version Missing Options in View Menu

The French version of Final Cut Express 1.0.1 is missing two commands from the Video submenu in the View menu.
This article has been archived and is no longer updated by Apple.

Symptom

The Video submenu in the View menu usually contains the commands: "RealTime", "FireWire", and "Show Current". In the French localization of Final Cut Express 1.0.1, though, only "Title Safe" and "Show Current" are available.

Solution

Video played through FireWire or in RealTime cannot be selected through the View menu in the French version of Final Cut Express 1.0.1.

Even though the menu commands are not available, you can switch between RealTime and FireWire by pressing Command-F12.

This document will be updated as more information becomes available.

PowerBook: SCSI Disk Mode and Termination

Macintosh PowerBook computers, with the exception of PowerBook 140, 145, 145B, 150, and 170, can function as an external hard drive to a desktop Macintosh via SCSI Disk Mode.
This article has been archived and is no longer updated by Apple.

Overview

SCSI Disk Mode (in the PowerBook's ROM) allows you to use a PowerBook as an external SCSI device. You can then connect the PowerBook to any other SCSI-equipped Macintosh and transfer files directly from the desktop Macintosh to and from the PowerBook.

Preliminaries

The two hard-drive volume names (the one in the desktop Macintosh and the one in the PowerBook) CAN'T be identical.
To use SCSI Disk mode, you need:
* The HDI-30 SCSI disk adapter, which plugs into the SCSI port of the PowerBook.
* A SCSI system cable and SCSI terminator.

Making the Connection

The Macintosh User's Guide for Macintosh PowerBook computers contains instructions for making the connections between the PowerBook and various desktop Macintosh systems. Just as with any other SCSI device, both the PowerBook and the desktop Macintosh MUST BE POWERED OFF when the cable connections are made. Make sure your PowerBook is not in Sleep mode.

Activating SCSI Disk Mode

1) Once you connect the cables, power up the PowerBook by pressing the appropriate key. The drive will then spin up.

2) Power up the desktop system. The PowerBook's hard drive should appear on desktop system's display (the PowerBook display will show a moving SCSI icon with the selected SCSI ID number.) In SCSI Disk Mode, treat the PowerBook like an external hard drive.

Exiting From SCSI Disk Mode

To exit SCSI Disk Mode, press the PowerBook's Reset switch or the interrupt switch, or both together. This shuts down the PowerBook to allow removal of the SCSI Disk Mode adapter.

The next time you turn on the PowerBook, it will start up as usual.

Termination

Most PowerBook computers, as well as the Macintosh Portable, provide internal hard disk drive termination. The 1.3 KOhm pull-up resistor provides a minimal amount of termination. Therefore, even though the system has internal termination, it requires an external terminator when used in SCSI Disk Mode.

PowerBook computers that use IDE (ATA) hard drives do not provide SCSI termination. This includes the Powerbook 1400 series and Powerbook 3400 series.

With the introduction of IDE (ATA) specification internal hard drives in Powerbook computers, in most cases (as outlined in the user's guide) it is necessary to use double-termination when connecting external SCSI devices to the Powerbook. When connecting a device with internal termination an extra external terminator should be placed between the cable and the device. If the device lacks internal termination a total of two external terminators are required. One should be placed between the cable and the device, and the second terminator should be applied to the second port on the device.

* Double-termination does not apply to Disk Mode or Target Mode applications.

* While in SCSI Disk Mode with a Macintosh IIfx, remember to use the black terminator between the adapter and the SCSI system cable. With other desktop Macintosh models, use the standard gray terminator.

Technical Notes

You enter SCSI Disk Mode by starting the PowerBook with a special adapter plugged into the SCSI connector on the back of the computer. The ROM code checks for the presence of the SCSI Disk Mode adapter. If the adapter is absent, the ROM sets the SCSI address to seven (normal CPU SCSI address), and continues to start up normally. If the cable is present, the ROM checks the battery voltage to see if it's high enough to enter SCSI Disk Mode. The ROM then changes the hard disk address to the address stored in PRAM, sets backlighting to minimum, turns on the hard drive, and begins animating the screen.

The SCSI Disk Mode ID number is set in the PowerBook control panel. The default is 1, but you can select any number from 1 to 6. This number is stored in parameter RAM (PRAM).

It's important to connect the SCSI Disk Mode adapter only when the PowerBook has been shut down. The firmware necessary to enter SCSI Disk Mode is executed only at startup. Because the SCSI Disk Mode firmware isn't executed when you connect the adapter during sleep, the SCSI bus potentially has two bus masters and two devices with SCSI ID 0, leading to potential data loss.

To prevent data loss in this situation, a modal warning dialog window appears and the menu bar isn't accessible. You have two options:

* Disconnect the SCSI Disk Mode adapter. Removing the adapter removes the warning dialog box, and you can resume using the system. Although this procedure is counter to the suggestion of always making connections while the system is shut down, you can do it with no problems under these circumstances. You can then shut down the system from the menu bar.

* Simultaneously press the Reset and Interrupt buttons. This shuts down the system, but all RAM data will be lost with no opportunity to save the data.

Burning playlists with purchased songs in iTunes 4.5 and later

This article has been archived and is no longer updated by Apple.

If a playlist contains any songs purchased from the iTunes Store, iTunes software restricts the number of times the same playlist may be burned to seven.

Notes

1. Music files you encode as an AAC file from a source other than the iTunes Store (such as an audio CD) do not need to be authorized.
2. iTunes lets you use the CD-RW drive, Combo drive or DVD-R/CD-RW SuperDrive in your Mac, to burn your own CDs. Some third-party drives may also work. See the drive compatibility page for Mac OS X 10.2 for information. Windows users click here to see if your drive can burn CD-R discs.

A note about copyright

iTunes software may be used to reproduce materials. It is licensed to you only for reproduction of non-copyrighted materials, materials in which you own the copyright, or materials you are authorized or legally permitted to reproduce. If you are uncertain about your right to copy any material, you should contact your legal advisor. See the iTunes Music Store Terms of Service for additional information.

400MB, 3.5-Inch, Half-High, SCSI Hard Disk Drive: Connectors

This article describes the connectors used in the 400MB SCSI hard disk drive.

This article has been archived and is no longer updated by Apple.

Power Connector

The power for the drive is provided through a 4-pin male polarized connector. Pin 1 is the rightmost pin when viewing the connector with drive top cover up.

SCSI Connector

The SCSI connector is a 50-pin, shrouded (4-sided), male, keyed, right-angle connector. Pin 1 is the rightmost pin of the upper row when viewing the connector with drive top cover up (key slot up).

Termination

Removable termination resistor packs with standard SCSI 220/330 termination resistors. The packs are removable without having to remove the board. The drive provides termination power to the TERMPWR line (pin 26) of the SCSI bus through a diode and provides a 1.5 amp current-limiting function.

Device Select Connector

The device select connector is a 6-pin male connector located behind the power connector along the drive side. Nominal pin spacing is 0.100 inches.

LED Connector

The LED connector is a 2-pin, right-angle, un-shrouded, nonpolarized male header to connect with the LED cable assembly. Nominal pin spacing is 0.100 inches. It is located on the opposite end of the drive from the SCSI connector.

Connector J6

Connector J6 is an 8-pin male connector located on the side of the drive away from the SCSI connector. Pin 1 is the bottom pin farthest from the SCSI connector end.

Pin 1 - Not Jumpered (Factory use only)
Pin 2 - Not Jumpered (Motor start option)
Pin 3 - Not Jumpered (Delayed Motor start option)
Pin 4 - Not Jumpered (Write-protect option)
Pin 5 - Jumper Installed (Parity checking and error reporting)
Pin 6 - Not Jumpered (Reserved for later use)
Pin 7 - Jumpered in a Macintosh Quadra 900/950
(Termination Power is supplied to the SCSI bus.)
Pin 8 - Jumpered in a Macintosh Quadra 700
(Termination is supplied to the drive terminators.)

Note

Pins 7 and 8 jumpered at the same time is allowed.

TA47617_MB_Inch_HalfHigh_SCSI_Hard_Disk_Drive_Connectors_(TIL09302).pdf

Published Date: Feb 18, 2012

400MB, 3.5-Inch, Half-High, SCSI Hard Disk Drive: Overview

This article describes the Apple 400MB SCSI hard drive.

This article has been archived and is no longer updated by Apple.
The 400MB hard disk drive is intended for use in the Quadra 700 and 900 computers, as well as other Apple products. The drive possesses features that benefit many different applications.

The hard disk assembly consists of as few mechanical components as possible. It's designed for simplified assembly without requiring sensitive adjustments or calibration during the manufacturing process.

Powerful data error correction techniques ensure data integrity. When power is turned on, the drive releases the actuator arm assembly from the locked position, only if the read/write heads have achieved a stable flying condition. This feature ensures no direct physical contact between the heads and the data area on the disk surfaces. If power shuts off suddenly, the actuator arm automatically retracts to the landing zone before the heads make contact with the disk surfaces.

Backing up your music files in iTunes 4

This article has been archived and is no longer updated by Apple.

Learn how to back up songs that are in your iTunes library. If you have iTunes 5 or iTunes 6, click here.

Be sure to make regular backups of your music files (in your iTunes Music folder) by copying them to an external hard disk or other media. Otherwise, if your hard disk becomes damaged or you lose any of the music you've purchased, you'll have to buy any purchased music again to rebuild your library.

Backing up your music to a CD or DVD

You can burn a data CD or DVD with any of the songs and spoken word content in your iTunes library. You might want to do this to make a backup copy (or archive) of all your audio files, or to transfer them to another computer.

To burn a DVD, your computer should have an internal SuperDrive and Mac OS 10.2.4 or later. Some third-party DVD burners may also work. You can store about 650 MB of files on a CD, and about 4.7 GB on a DVD.

To create a playlist of your entire library

1. Open iTunes.
2. Click Library in the Source list.
3. Click the Browse button or choose **Show Browser** from the **Edit** menu.
4. Make sure "All" is selected for Genre, Artist, and Album.

5. Click any single song, then choose **Select All** from the **Edit** menu.

6. From the **File** menu, choose **New Playlist From Selection**.
7. Type a name for the new playlist.

Note: If you don't mind re-importing your other music from your CD collection, you can just back up yout iTunes Store and Audible content by creating a smart Playlist that contains all songs and audiobooks with Kind set to Protected AAC audio file or Audible file as shown here:

To burn a data CD or DVD

1. Open iTunes.
2. From the **iTunes** menu, choose **Preferences** (Windows: From the **Edit** menu, choose **Preferences**).
3. Click the Burning button.
4. Choose Data CD or DVD as the Disc Format.
5. Click OK.
6. Create a playlist that includes all the items in your library (see steps above), or all the items you want to back up to the CD or DVD.
7. Select the playlist you want to burn to the CD or DVD, then click the Burn Disc button.
8. Insert a blank CD-R, CD-RW, DVD-R, or DVD-RW disc, and click Burn Disc again.

Any audio files in the playlist (MP3, AAC, AIFF, WAV, Audible) are copied to the CD or DVD.

Tip: You can only burn a CD or DVD from the songs in a playlist. If the playlist contains more songs than will fit on a single disc, iTunes will notify

you and will give you the option to use multiple discs. You can see the size of the selected playlist at the bottom of the iTunes window.

Data CDs or DVDs will work on your computer, but will not work in most CD/DVD players.

You can make regular, incremental backups of your music (that means only backing up what has changed).

Restoring music files from backup:

To add music files back into your iTunes library from your backup discs:

1. Insert the disc into your computer. The disc shows up in iTunes.
2. Click the disc in the Source list.
3. Click the Browse button in the upper right to make browsing the disc easier.
4. Locate the songs, albums, artists or entire genres you are missing.
5. Drag the missing files to Library in the Source list.

A note about copyright iTunes software may be used to reproduce materials. It is licensed to you only for reproduction of non-copyrighted materials, materials in which you own the copyright, or materials you are authorized or legally permitted to reproduce. If you are uncertain about your right to copy any material, you should contact your legal advisor. See the iTunes Store Terms of Service for additional information.

Slow performance when using the iTunes Store on a dial-up connection

This article has been archived and is no longer updated by Apple.

If you connect to the iTunes Store using a dial-up connection over a phone line, music previews might sound odd or they might not play at all.

The iTunes Store rocks with a high-speed (broadband) Internet connection like DSL or cable modem. Broadband is the best way to experience the iTunes Store, but if for whatever reason you can't get a high-speed connection, there is something you can do to get the previews to play.

1. Open iTunes and then go to the iTunes Preferences:
   Windows: On the **Edit** menu, click **Preferences**.
   Mac: From the **iTunes** menu, choose **Preferences**.
2. Click the Store tab at the top of the window.
3. Check the "Load complete preview before playing" checkbox.

4. Click OK.
5. Try previewing the song again.

Because the preview will download completely, the preview should sound great when you play it.

Tip: The preview is a small segment of the song on the iTunes Store. If the preview doesn't sound right to you, even after the it loads completely, the song probably won't sound right, either.

Keynote: How to Add Page Numbers to All Slides

This document explains how to add page numbers that automatically increment as you arrange or add slides.
This article has been archived and is no longer updated by Apple.
To automatically update page numbers on slides as you create or arrange them, add a page number to the master slide(s). Follow these steps:

1. Open Keynote.
2. Open your document or create a new document.
3. Choose View > Show Master Slides.
4. Select the master slide in the Master Slides column.
5. Choose View > Show Inspector.
6. Select the "Show Slide #" checkbox in the Layout pane of the Master Slide inspector window.
7. Position the page number in the master slide

Repeat steps 4 through 7 for each master slide you want to number.

68040 CPU Architecture: NuBus Transfer Modes and Performance

Can you give information about the architecture of the 68040 CPU? It isn't clear which master/slave transfer modes are supported in the 68040 computer between the host and the NuBus. What would the NuBus Block Transfer Modes Resource Entries look like for the 68040 computer per the DTS Technical Note #288? What performance can we expect?
This article has been archived and is no longer updated by Apple.
The Macintosh Quadra computers support all sizes of block transfers when the main logic board is accessed as a slave device. (The NuBus specification states that if a slave accepts any block transfer, it must accept all block transfers.) As a NuBus master, the Quadra doesn't initiate block transfers. NuBus masters don't have to support all sizes of block transfers.

The data rate a NuBus master will see when doing block transfers to the main logic board is 8 to 10 MB/sec, depending on main memory refresh cycles and synchronization delays. This is a maximum rate that can be achieved only if the NuBus master does nothing but block transfers (that is, it moves data continuously without doing any other operations). A more realistic maximum rate is 4 to 5 MB/sec.

When the main logic board is the bus master, the transfer rate depends greatly on the speed of the NuBus slave device. A zero wait state NuBus slave (none of which exist as far as we know) could give peak transfer rates approaching 20 MB/sec. Real NuBus slave devices will probably have transfer rates under 10 MB/sec (more like 2 to 4 MB/sec). The only way to really determine how fast a Quadra can transfer data to a NuBus slave is to run real code and time the bus transfers.

iTunes 4: Effects Can Cause Some Sound Fluctuation During Playback

Update to a later version of iTunes 4 if you hear a rapid fluctuation in volume in iTunes 4.0.
This article has been archived and is no longer updated by Apple.

Symptom

When playing a song, the sound volume fluctuates rapidly, or you hear other distortions.

Solution

Download and install iTunes 4.0.1 or later. It is available from the Software Update pane in System Preferences, or from the iTunes website (http://www.apple.com/itunes/download/).

Published Date: Feb 18, 2012

QuickTime: About the QuickTime 6.2 Update

The QuickTime 6.2 Update enhances QuickTime to work with iTunes 4 and addresses certain issues.
This article has been archived and is no longer updated by Apple.
This software updates QuickTime 6.0, 6.0.1, 6.0.2, 6.1 or 6.1.1 to QuickTime 6.2.

System Requirements

To use QuickTime 6.2, your computer should meet these system requirements.

- PowerPC G3, or PowerPC G4 microprocessor
- Mac OS X 10.1.5 or later
- A minimum of 128 MB of memory (RAM)

Automated Software Update Installation

1. Choose Apple menu > System Preferences.
2. Choose View > QuickTime.
3. Click the Update tab.
4. Click Update Now.

Note: QuickTime 6.2 is also available as an update in the Software Update pane of System Preferences.

Standalone Installer

A standalone installer is available from the QuickTime download website (**http://www.apple.com/quicktime/download/**).

About QuickTime 6.2

QuickTime is Apple's award-winning, industry-leading software architecture for creating, playing, and streaming digital media for Mac OS and Windows.

Enhancements in QuickTime 6.2

- Foundation support for iTunes 4
- Enhanced AAC audio encoder (QuickTime Pro only)

This update is recommended for users of iTunes 4. It allows you to do the following:

- Use music purchased from the iTunes Store in other applications.
- Within iTunes 4, you can now import CDs into AAC, the new industry standard for high-quality digital audio.

QuickTime Pro users also get access to an enhanced AAC encoder.

Enhancements in previous versions of QuickTime 6

- MPEG-4 ISO compliant file creation
- MPEG-4 video codec
- AAC audio codec
- Instant-On streaming
- Macromedia Flash 5
- Enhanced QuickTime Player interface
- QuickTime Picks, bringing you the best, up-to-date content

Using QuickTime 6.2 with other applications

- iMovie 3
  If you encode your own .m4a (AAC encoded audio) files or bring .m4p (AAC Protected audio) from another computer you will be unable to use the Import command in iMovie 3. Bring the files into iTunes first. They can then be accessed via the audio pane in iMovie 3.

For more information, see the QuickTime Web site at (**http://www.apple.com/quicktime/**). The QuickTime Web site also provides many links to cool QuickTime content and to other Internet sites that showcase QuickTime.

Macintosh Quadra 900: Dual Channel SCSI

What is the value of dual channel SCSI on the Macintosh Quadra 900?

This article has been archived and is no longer updated by Apple.
The dual SCSI implementation on the Quadra 900 means several things:

- Because the SCSI chains are electrically separate, there won't be any interruption on the internal chain if something goes wrong on the external chain (like a disconnect while the computer is on, poor termination schemes, and so on).

- It gives third parties (and potentially Apple) the opportunity to implement disk arrays using the two chips. Micronet is advertising their Raven array without using two NuBus slots.

- You can assure speed of the drive internally using the internal cabling, and not limit the speed of a drive by the cable you use (frayed cables, bad cables, and so on).

MacTCP: Releasing IP Addresses

A Macintosh with MacTCP installed refuses to give up a dynamically assigned IP number until the we restart the computer.

If a Macintosh uses an application that requires an IP number from the network (in this case a GatorBox and no MacTCP installed) and the application is no longer in use, the IP is released for use by someone else. This is what it's supposed to do.

When we add the MacTCP drivers and run an application that requires MacTCP and an IP number, the Macintosh doesn't release the IP number, even after quitting this program. My explanation is the MacTCP drivers are now loaded into the Macintosh and reside there, holding on to the IP number. Hence, until the machine is shut off or restarted, it doesn't release the number.

Is this normal, and should I look for a way to release the number without shutting off the Macintosh? Or is this a bug that will be fixed or maybe someone has come up with a fix?

I have been told that the node number and IP numbers are all reset at startup time. Is this correct?

This article has been archived and is no longer updated by Apple.
You are correct; MacTCP doesn't release an acquired IP address until you restart the Macintosh.

In the first instance you mention, an application has its own TCP/IP driver; NCSA Telnet 2.3 (non-MacTCP) is a good example. When Telnet tries to open a session, the built-in TCP/IP driver is opened and an IP address is obtained. When you quit the application, the driver is removed from memory and the IP address is released.

With MacTCP, when an application or DA opens the driver, an IP address is obtained. Since MacTCP is a system-wide resource not limited to a specific application, the driver is not removed from memory when the application is quit because other applications or DAs may be using the driver as well. This causes the IP address to remain in use until you restart the computer.

This behavior is not a bug, and will not be changed in a future release of MacTCP.

iSync 1.0: Cannot Sync To Do List With iPod (with Dock Connector)

iSync 1.0 does not sync To Do lists with the iPod (with Dock Connector).
This article has been archived and is no longer updated by Apple.

Symptom

After syncing with iSync, the calendar and address book information appears on iPod, but To Do information does not.

Solution

Update to iSync 1.1 or later to synchronize To Do items with your iPod (with Dock Connector). To download the latest version of iSync, visit the iSync website (http://www.apple.com/isync/).

Earlier iPod models do not have a To Do feature to view To Do items. This includes any iPod using version 1.x of the iPod software. iSync will not synchronize To Do items with these iPods.

LaserWriter IIg: LocalTalk and EtherTalk Zones

I have a question about the LaserWriter IIg. I have the same printer name on both the LocalTalk zone and the Ethernet zone, and the printer is connected to both LocalTalk and Ethernet. Between these zones I have an AppleTalk Internet Router.

When I print from a Macintosh on Ethernet to the LaserWriter, I can actually reach the printer from both Ethernet and LocalTalk. Which printer port is used in that case? Does it choose the shortest way, or does it prefer LocalTalk?

This article has been archived and is no longer updated by Apple.
If a LaserWriter IIg is connected to the same Internet via LocalTalk and EtherTalk, and the LocalTalk and EtherTalk connections are in the same zone, the LocalTalk connection is shut down.

If the LocalTalk and EtherTalk connections are in different zones, the printer will be advertised in both zones. If you select the LaserWriter IIg via the LocalTalk zone, all communications go through the LocalTalk port. If you select the LaserWriter IIg via the EtherTalk zone, all communications go through the EtherTalk port.

Keynote: "Can‘t apply theme" Alert

You may not be able to open Keynote themes if Hebrew is the preferred language in the International preference pane.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to select a theme in Keynote an alert with this message appears:

> "Keynote can't apply the theme /resources/keynote.app/contents/resources/themes/<themename> to the current document because there is a problem with the theme".

Solution

Check to see if Hebrew is the preferred language in the International preference pane:

1. Choose Apple > System Preferences.
2. Choose View > International.
3. Click the Language tab, if necessary.
4. If Hebrew is the first language listed in the Languages area, drag English, French, or Spanish to the top of the list so that it becomes the preferred language.
5. Choose Apple menu > Log Out.
6. Log in.

Keynote should now open themes.

LaserWriter II Fonts 1 Disk: Zapf Dingbats Incorrectly Named

When printing to the Apple LaserWriter IIf or Apple LaserWriter IIg from a Macintosh using System 7 and the LaserWriter 7.0 driver, the system will not download the Zapf Dingbats PostScript font that comes on the "LaserWriter II Install 4.0" disks. These disks come with the Apple LaserWriter IIg and Apple LaserWriter IIf.

This article has been archived and is no longer updated by Apple.

The problem with the Zapf Dingbats font on the LaserWriter II Fonts 1 disk (one of the "LaserWriter II Install 4.0" disks) is that the Postscript file is named incorrectly to be temporarily downloaded by the LaserWriter driver. The filename as it appears on the disk is "Zapf Dingbats." For the font to be downloaded by the LaserWriter driver, the downloadable Postscript file needs to be called "ZapfDin". Note: The incorrect name doesn't interfere with the LaserWriter Utility's ability to download the font into the printer's memory.

iTunes 4: How to Create Your Own MP3 CDs

You can use iTunes to create a data CD with the music stored in MP3 format.
This article has been archived and is no longer updated by Apple.
Creating your own MP3 CDs

You can use iTunes to create a data CD with the music stored in MP3 format. MP3 is a high-quality, Internet-standard encoding method. You can listen to the MP3 CDs you create in iTunes on special consumer CD players or on your computer.

You can store over 12 hours of music, or about 150 songs, on a 650 MB CD-R disc.

1. Choose iTunes > Preferences, then click the Burning button at the top of the window.
2. Choose MP3 CD as the Disc Format, then click OK.
3. Select the playlist you want to burn to the CD, then click the Burn Disc button.
    - You can only burn a CD from the songs in a playlist. For instructions on creating your list of songs, search the Knowledge Base or Mac Help.
    - If the playlist contains more songs than will fit on the CD, iTunes will only burn as many songs as will fit on the disc. (You can see the size of the selected playlist at the bottom of the iTunes window.) If necessary, you may need to create more than one playlist and burn each one to a CD.
4. Insert a blank CD-R disc and click Burn Disc again.

If you plan to only play the CD using your computer, you can also use a CD-RW disc. To play it on a digital music player or computer, use a CD-R disc.

If your playlist includes songs in formats other than MP3, they will not burned on the CD. See technical document 93071 "**iTunes 4: Music Purchased From iTunes Store Cannot Be Burned to MP3 Disc**" for additional information.

The songs sound as good on the CD as they do in iTunes. Songs you download from the Internet may be encoded differently, so their quality may be different.

For information about buying CDs, choosing import options, or creating an audio CD or data DVD, search the Knowledge Base or Mac Help.

This information comes from Mac Help, the help system included with your computer. This information comes from iTunes version 4. You should refer to the Help menu on your computer if you have a different version. Updated or expanded information may also exist elsewhere in the Knowledge Base.

LaserWriter II: "Unlimited Downloadable Fonts" Slowdown

I have an Excel 3.0 document that uses the Zapf Dingbats fonts. The document takes 30 seconds to print on my Personal LaserWriter NT. The same document takes 10 minutes to print on the LaserWriter IIf. I'm using System 7 with the Zapf Dingbats PostScript in the System Folder (it is named "ZapfDin"). Other documents in Word, FileMaker, and so on, print fine on the LaserWriter IIf.

This article has been archived and is no longer updated by Apple.
We looked at the "Page Setup..." options for the document you sent. The "Unlimited Downloadable Fonts in a Document" option was turned on. With this option enabled, any font that the driver downloads is purged as soon as another font is used, even if this other font is in the printer's ROM. The document has Zapf Dingbats characters interspersed throughout. Zapf Dingbats is downloaded the first time the font is used. As soon as another font is used, Zapf Dingbats is purged from memory. When it's used again, the LaserWriter driver has to download the font again. Because of the layout of the document, the Zapf Dingbats PostScript is downloaded dozens of times.

If you disable the "Unlimited Downloadable Fonts in a Document" option, the document takes 30 seconds to print on the LaserWriter IIf.

iTunes 4: "Shared Music Library Is Not Compatible" Alert

Computers with iTunes 4.0 are unable to share music with computers that have iTunes 4.0.1 or later installed.
This article has been archived and is no longer updated by Apple.

Symptom

This alert appears: "The shared music library <shared library name> is not compatible with this version of iTunes."

This occurs when you click on a shared music library in the Source list.

Solution

If you are using iTunes 4.0
Download and install iTunes 4.0.1 or later. See the iTunes website for update information (http://www.apple.com/itunes/).

If you are using iTunes 4.0.1 or later
The computer sharing the music library to needs to update to iTunes 4.0.1 or later.

iTunes 4.0.1 only allows music sharing between computers using iTunes 4.0.1 or later on a local network (in the same subnet).

QuickTime 6.3 Software Update Does Not Appear in Update Window or Will Not Install

QuickTime 6.3 requires Mac OS X 10.2.3.
This article has been archived and is no longer updated by Apple.

Symptom

One or both of the following may occur:

- The QuickTime software update does not appear in the Software Update window.
- The alert "This disk is dimmed because the system version is not at least 10.2.3" appears when you try to use the standalone installer on a computer with Mac OS X 10.2, 10.2.1 or 10.2.2.

Solution

1. Download and install Mac OS X 10.2.3 or later. It is available from the Software Update pane of System Preferences, or from Apple Software Downloads (http://www.apple.com/swupdates/).
2. Reinstall the QuickTime 6.3 update.

Published Date: Feb 18, 2012

QuickTime: About QuickTime 6.3

QuickTime 6.3 includes new features and enhancements.
This article has been archived and is no longer updated by Apple.
This software updates QuickTime 6.0 through 6.2 to QuickTime 6.3.

System Requirements

To use QuickTime 6.3, your computer should meet these system requirements.

Macintosh

- Macintosh computer with 400 MHz PowerPC G3 or faster
- Mac OS X 10.1.5
- Mac OS X 10.2.3 or later
- A minimum of 128 MB of memory (RAM)

Windows

- Intel Pentium or compatible microprocessor
- Windows 98
- Windows Millennium Edition (Me)
- Windows 2000
- Windows XP
- A minimum of 128 MB of memory (RAM)

How to update

Automated Software Update Installation (Mac OS X)

1. Choose Apple menu > System Preferences.
2. Choose View > QuickTime.
3. Click the Update tab.
4. Click Update Now.

Note: QuickTime 6.3 is also available as an update in the Software Update pane of System Preferences. It will not appear in Software Update for computers with Mac OS X 10.2, 10.2.1, or 10.2.2. Use the steps above instead.

Automated Software Update Installation (Windows)

1. Open the QuickTime folder.
2. Open the QuickTime Updater application program. It automatically checks the server, then downloads and installs the update.

Alternatively, open the QuickTime Player application, and choose Help > "Check for QuickTime Updates". Make sure you have an active Internet connection before you check for updates.

Standalone Installer
Standalone installers for Mac OS X and Windows are available from the QuickTime download website (**http://www.apple.com/quicktime/download/**).

About QuickTime 6.3

QuickTime is Apple's award-winning, industry-leading software architecture for creating, playing, and streaming digital media for Mac OS and Windows.

Enhancements in QuickTime 6.3

- Support for 3GPP, the new standard for multimedia on wireless devices, including:
    - AAC and AMR audio
    - MPEG-4 and H.263 video
    - 3G Text
    - Native .3gp file format support (available via the 3GPP Component, a free download at

http://www.apple.com/quicktime/download/)

- Playback of .amr and .sdv files (available via the 3GPP Component, a free download at http://www.apple.com/quicktime/download/).
- Automatic detection of streaming transport.
- Improved MPEG video playback in Keynote.
- Significant improvements to DV audio and video synchronization.
- Import and playback of Kodak DCS Photo Desk JPEG files.

QuickTime Pro users also get access to an enhanced AAC encoder.

Enhancements in previous versions of QuickTime 6

- Foundation support for iTunes 4
- Enhanced AAC audio codec (QuickTime Pro only)
- Enhanced MPEG-4 video codec.
- Full screen mode enhancements, including keyboard shortcuts and performance improvements
- Significant improvements to DV codec performance
- MPEG-4 ISO compliant file creation
- Instant-On streaming
- Macromedia Flash 5
- Enhanced QuickTime Player interface
- QuickTime Picks, bringing you the best, up-to-date content

For more information, see the QuickTime website at (**http://www.apple.com/quicktime/**). The QuickTime website also provides many links to cool QuickTime content and to other Internet sites that showcase QuickTime.

AppleTalk Internet Router: What Happens with More than 256 Zones

I know the AppleTalk Internet Router supports up to 256 zones on an Internet. What happens to the AppleTalk Internet Router when the Internet it is attached to exceeds 256 zones?

This article has been archived and is no longer updated by Apple.
The AppleTalk Internet Router continues to run on an Internet with more than 256 zones. The AppleTalk Internet Router doesn't return an error message in this situation.

The router will enter only 256 zones into its Zone Information Table. If the router has defined 10 zones on its own, it accepts the first 246 zones in the ZIP Reply packets it receives from the router on the Internet that responds to its ZIP Query packet. It discards the remaining 10 zones. Nodes that use this AppleTalk Internet Router to access the rest of the Internet won't be able to do NBP lookups for devices in the 10 missing zones.

Published Date: Feb 18, 2012

iMovie 3.0.3: The Ken Burns Effect Won‘t Stay On

The way to use the Ken Burns Effect in iMovie 3.0.3 changed from earlier versions.
This article has been archived and is no longer updated by Apple.
Sometimes it may appear that the Ken Burns Effect won't stay on. For example, if you turn off the effect and add a photo with no motion to your movie, then select the Ken Burns Effect checkbox, clips that you select in the Photos pane don't show motion in the Preview monitor (even though the checkbox is selected). If you select another photo and drag it to your movie, the Ken Burns Effect checkbox is automatically deselected and the photo is added as a still.

This lack of motion saves your computer's processor time and allows iMovie to perform faster because it doesn't need to create motion where there is none. It also saves you time if you want to add a lot of still images quickly.

If you want to add pan and zoom to a photo after you've added a still image, select the Ken Burns Effect checkbox and set up the pan and zoom effects you want. When you click Apply, the clip renders as usual, and the Ken Burns Effect checkbox stays selected.

This information comes from the Late Breaking News document included with iMovie 3.0.3.

Cinema Tools: Empty Scene and Take Fields May Not Be Populated

Importing clips into Cinema Tools without information in the scene and take fields may result in those fields being empty in the Cinema Tools database.

This article has been archived and is no longer updated by Apple.

Symptom

Scene and take information is not listed for the clip in the Cinema Tools database.

Solution

This is expected behavior. You can force scene and take information to appear by either:

- Explicitly adding the information in Final Cut Pro.

or

- Use a hyphen in the clip name. Cinema Tools will parse the information after the hyphen as the scene and take.

Published Date: Feb 18, 2012

Cinema Tools 1.0: Cannot Handle Keynumbers Beyond 9999

Cinema Tools 1.0 is unable to handle keynumbers that "roll over" from 9999 to 0000, a convention common with some brands of film (such as Fuji), although it will not happen with Kodak film.
This article has been archived and is no longer updated by Apple.

Symptom

Cinema Tools adds a fifth digit to the keynumber instead of rolling over to 0000.

Solution

Upgrade to Final Cut Pro 4.0, which includes Cinema Tools 2.0.

Final Cut Pro 4: Text Tracking May Change When Upgrading Final Cut Pro 3 Projects

When upgrading a Final Cut Pro 3 project to Final Cut Pro 4, be sure to check any text generators you've added for consistency.
This article has been archived and is no longer updated by Apple.

Symptom

In a project upgraded from Final Cut Pro 3 to Final Cut Pro 4, text created with one of Final Cut Pro's text generators is wider or narrower than before.

Products affected

- Final Cut Pro 4

Solution

Adjust the text tracking as necessary to ensure that the appearance of the text is consistent with its appearance in Final Cut Pro 3.

Additional information

The method for determining text tracking has changed between Final Cut Pro 3 and 4. When upgrading a Final Cut Pro 3 project to Final Cut Pro 4, be sure to check any text generators you've added for consistency.

Kanji 6.0.7 and 6.0.7.1: Use U.S. Backlit Portable INIT (7/94)

Is a localized version of the Portable CDEV available for Kanji 6.0.7 that supports backlit Portables? The Portable CDEV in the Kanji system 6.0.7 on Developer CD Vol. VIII is localized, but doesn't support backlit Portables, it is for contrast only. I moved the U.S. English Portable CDEV v1.3 over to Kanji 6.0.7, and it works, but I can't find one that is both localized AND supports backlighting.

This article has been archived and is no longer updated by Apple.
You're right. The Backlit Portable INIT wasn't localized in Japanese (current versions of system software, 6.0.7 and 6.0.7.1). So to use KanjiTalk on the Backlit Portable, you'll need to use U.S. Portable INIT to control the screen brightness.

iDVD 3: Chapter Marker Submenu Not Created for Movies Over 60 Minutes

A chapter marker submenu is not created in iDVD 3 when importing a movie over 60 minutes long if the "importing movies" preference is set to "ask each time."
This article has been archived and is no longer updated by Apple.

Symptom

No chapter submenus are created when importing a movie over 60 minutes in length.

This happens if the preference for importing movies is set to "ask each time."

Solution

1. Open iDVD.
2. From the **iDVD** menu, choose **Preferences**.
3. Click the Movies icon.
4. Select the "automatically create" option for "when importing movies".

Additional Information

When importing a movie containing chapter markers, iDVD 3 will create a "scene selection" submenu containing buttons for the chapters. If the preference for importing movies is set to "ask each time," iDVD will ask whether to create a chapter submenu. However, if the movie being imported is over 60 minutes long, iDVD will warn that the duration of the project is changing, but will not ask whether to create a chapter submenu. No chapter submenu will be created.

Note: This does not occur with iDVD 3.0.1 or later.

iMovie 3: Buzzing Noise During Transition Clip

Transitions applied between a still clip and a video clip may produce a "buzzing" noise. This document explains how to correct this issue.
This article has been archived and is no longer updated by Apple.

Symptom

After applying a transition between a still clip and a video clip, there is a buzzing noise during the transition when you play the movie.

Solution

Download and install iMovie 3.0.3 or later. It is available from the iMovie website (http://www.apple.com/imovie/).

To resolve this issue with clips that were imported before upgrading to iMovie 3.0.3:

1. Delete the affected transition.
2. Remove the still clip adjacent to the affected transition.
3. Reimport the still clip and move it to the timeline.
4. Re-apply the transition.

Soundtrack 1.0: Saving Collected Files Resets Loop Transients

Saving a Soundtrack project using the "Collected" option can cause audio loops to have their modification date changed, resetting the loop transients next time the loops are opened in Soundtrack or Soundtrack Loop Utility.
This article has been archived and is no longer updated by Apple.

Symptom

One or both of the following occur:

- After saving a project as "Collected," sound quality is reduced or isn't properly matched to the project's key and tempo.
- In Soundtrack Loop Utility the transients are all evenly spaced and don't match the waveforms in the audio.

Solution

Update to Soundtrack 1.1. Use Software Updates in System Preferences to install the updates. **Note**: The Pro Apps Support package (ProKit Framework) must be installed first. Once the Pro Apps Support Package is installed, then click Check Now in Software Update again to see the Soundtrack update.

AppleWorks 6: How to Change the Highlight Color

AppleWorks uses the Mac OS X System Preferences highlight color.
This article has been archived and is no longer updated by Apple.
With Mac OS X, AppleWorks uses the System Preferences highlight color when selecting text and when selecting cells in the spreadsheet.

You can change highlight color in System Preferences. To do this:

1. Choose Apple > System Preferences.
2. Choose View > General.
3. Choose a color from the Highlight Color pop-up menu.

If you want a color that is not shown, choose Other to see the Color Picker dialog.

Note: This will affect the highlight color for any application that uses the System Preferences settings.

Ethernet NB Card: Works Under A/UX 2.0.1 for Native TCP/IP

Article Change History

08/31/92 - REVIEWED
o For technical accuracy.

Does the new Apple Ethernet NB Card under A/UX 2.0.1 work for native TCP/IP communications?

This article has been archived and is no longer updated by Apple.
Yes, the new Apple Ethernet NB Card does work under A/UX 2.0.1 for any TCP/IP communication. Note that there is a special driver ("as") that you need to install with the EtherTalk startup disk that came with the Apple Ethernet NB Card package. Follow the instructions in the Apple Ethernet NB Card User's Guide to do the installation for A/UX.

A/UX: BBX Works with A/UX 3.0 (9/94)

There is a problem with the A/UX pseudo-tty driver when running BBX (a 4GL development tool from BASIS International). Here is a detailed description of the problem:

When I open a pseudo-tty with the O_NDELAY flag, some of the output doesn't show up on the screen until AFTER I type a character on the screen. The pty is opened unbuffered -- this is something internal to the system. The first half of a page of text prints out. I have to type something to print the rest of the page.

This doesn't happen on the console or serial ports -- only the ptys. I'm using read() and write(), not stdio, and it's unbuffered. Doing an ioctl(tcsetaw) on the fd of the pty fixes the problem, but shouldn't be necessary.

This article has been archived and is no longer updated by Apple.
There is a new kernel patch for the problem between A/UX pseudo tty and BBX. We tested the BBX software with the new kernel, and it works well. This patch fixes the longstanding problem between A/UX and BBX. This fix is now included in A/UX 3.0.

iMovie 3.0.3: Projects Don‘t Open In Final Cut Express or Final Cut Pro

Final Cut Express and Final Cut Pro 4 can open iMovie 3 projects. However, projects saved from iMovie 3.0.3 will not open correctly.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to open an iMovie project, this message appears: "Unable to open iMovie project. Final Cut Pro (or Express) requires iMovie 3.0 project files."

Solution

For Final Cut Pro 4
Update to Final Cut Pro 4.0.1 or later (4.1-J or later for Japanese versions). Use Software Updates in System Preferences to install the updates.
Note: The Pro Apps Support package (ProKit Framework) must be installed first. Once the Pro Apps Support Package is installed, then click Check Now in Software Update again to see the Final Cut Pro update.

For Final Cut Express
Update to Final Cut Express 2.0 or later.

Shake Qmaster: Changing the Minimum Frames Setting For Shake Jobs

This document discusses the Minimum frames setting for batches submitted for processing with Shake Qmaster.
This article has been archived and is no longer updated by Apple.

Changing the Minimum Frames Setting for Shake Jobs

When you submit batches for processing with Shake Qmaster, a command dialog appears when you add a Shake job to a batch. Most of the settings in this dialog correspond to commonly used Shake commands. However, the Minimum setting is unique to submitting Shake jobs with Shake Qmaster and requires some explanation.

As described in the Shake Qmaster User's Manual, Shake Qmaster divides Shake jobs into segments of frames for efficient distributed processing. For example, one service node may process frames 1 through 10, while another service node processes frames 1 through 21.

When you are submitting a Shake job, you can change the value in the Minimum field to change the minimum number of frames in each Shake Qmaster segment. For example, with a minimum value of ten (the default), Shake Qmaster would divide a 100-frame job into at least ten segments of ten frames each. If you changed the minimum value to five, Shake Qmaster would divide a 100-frame job into at least 20 segments of five frames each. When you set a minimum, keep in mind that while smaller segments allow a job to be distributed to more nodes at once, smaller segments can also mean that more processing effort is spent on opening and closing Shake on each node.

This information comes from the Qmaster Late Breaking News for Shake version 3.0. You should refer to the Help menu on your computer if you have a different version. Updated or expanded information may also exist elsewhere in the Knowledge Base.

TA47668_Macintosh_LC_Video_Specifications_(TIL09323).pdf

Macintosh LC: Video Specifications

I'm looking for the video specifications for the Macintosh LC. What are the Macintosh LC video characteristics (such as Horizontal and Vertical frequencies), and are they interlaced? (I understand the Horizontal and Vertical frequencies vary with the monitor.)

This article has been archived and is no longer updated by Apple.
The Macintosh LC has three modes of operation, based on the monitor connected: 12-inch RGB, 12-inch monochrome/13-inch RGB, and VGA. The timings for these Macintosh LC video modes are the same as for other Macintosh models supporting these same monitors.

Monitor	Vertical Refresh Hz	Horizontal Refresh KHz	Dot Clock MHz
12-inch RGB	60.15	24.48	15.7
VGA	59.95	31.47	25.175
12-inch Monochrome and 13-inch RGB	66.7	35	30.2

None of the Macintosh LC video modes uses interlace scan. All modes use a progressive scan.

Shake Qmaster: Monitoring Extended Node Cluster Activity

This document describes how to use Batch Monitor to monitor extended node (QuickCluster) cluster activity.
This article has been archived and is no longer updated by Apple.

Monitoring Extended Node (QuickCluster) Cluster Activity

In the Batch Monitor, you cannot view clusters in administrator mode if they were created with the Shake Qmaster System Preferences QuickCluster option. To monitor the status of batches submitted to extended node clusters, use the Batch Monitor in user mode by opening the Batch Monitor in any of the following ways:

- Use the Batch Monitor that automatically opens after you submit a batch.
- Click the Batch Monitor button in the Shake Qmaster window.
- Double-click the Batch Monitor application icon (/Applications/Utilities).

Compressor: Unable to connect to background process

This article has been archived and is no longer updated by Apple.

In some situations submitting a job in Compressor fails even though a valid source, preset, and destination have been added.

Symptom

The Submit button is dimmed in Compressor's Batch window, or a message appears stating "Unable to connect to background process" when submitting a job. This can occur due to an issue during Compressor's installation.

To prevent this, either completely disable or temporarily remove third-party antivirus software or disk utilities which may run background processes during Compressor's installation.

Solution

Compressor 2

If this issue occurs with Compressor 2, go to /Library/Receipts and, if found, drag the following files to the Trash:

- Compressor.pkg
- Qmaster_Applications.pkg
- Qmaster_Frameworks.pkg
- Qmaster_Plugins.pkg
- Qmaster_Services.pkg

Then, go to /Applications and, if found, drag the following files to the Trash:

- Compressor
- Apple QMaster
- Apple Qadministrator

From your install disc, reinstall Compressor and Apple Qmaster (in custom install window, make sure that Compressor and Apple Qmaster items are checked). Once you have reinstalled the Compressor and QMaster applications and services, install all updates using Software Update and restart your computer.

Compressor 1

If you see the security alert described in "Qmaster startup item evokes security message in Mac OS X 10.4 Tiger," click "Fix" and restart your computer.

If you have Mac OS X 10.3 or Mac OS X 10.4 Tiger, update to Compressor 1.2.1.

If the issue continues:

1. Click the Finder in the Dock.
2. From the **Go** menu, choose **Go To Folder**.
3. Enter "/Library/Receipts" and click Go.
4. If present, drag files which contain the name "CompressorUpdate" to the Trash.
5. From the **Go** menu, choose **Go To Folder**.
6. Enter "/Library/Frameworks" and click Go.
7. Drag the file "Compressor.framework" to the Trash.
8. Install Compressor from your original software discs.
9. Use Software Update to update Compressor to version 1.2.1.

If this does not resolve the issue and you have both Final Cut Pro 4 and DVD Studio Pro 3 then do the following:

1. Reinstall Final Cut Pro 4 and download and install all updates.
2. Install DVD Studio Pro 3 making sure to select "Custom" and uncheck Compressor to install only DVD Studio Pro and A.Pack.

Note: If you have only one of these applications, then reinstalling the single application should resolve the issue.

For Mac OS X 10.2 to 10.2.8

In most situations, updating to Compressor 1.1 should resolve this. You can use Software Update in System Preferences to install the updates. **Note**: The Pro Apps Support package (ProKit Framework) must be installed first. Once the Pro Apps Support Package is installed, then click Check Now in Software Update again to see the Compressor update.

If the issue continues, it may be because DVD Studio Pro 2 was installed after installing Compressor 1.1. DVD Studio Pro 2 installs some components that do not work with Compressor 1.1. To resolve this, follow these steps:

1. Click the Finder in the Dock.
2. From the **Go** menu, choose **Go To Folder**.
3. Enter "/Library/Receipts" and click Go.
4. Drag the file "CompressorUpdate1.1.pkg" to the Trash.
5. From the **Go** menu, choose **Go To Folder**.
6. Enter "/Library/Frameworks" and click Go.
7. Drag the file "Compressor.framework" to the Trash.
8. Install Compressor from your original software discs.
9. Use Software Update to update Compressor to version 1.2.1.

See "Compressor: Troubleshooting basics" for other troubleshooting information.

AFE: Remove ProDOS or MS-DOS File System Before Translating

Is there a problem using Apple File Exchange with Works-Works Transporter v2.0 and the ProDOS File System INIT that comes with the Apple IIe Card used on the Macintosh LC?

I have a Macintosh LC and I want to convert AppleWorks files to Microsoft Works files. I can't do this when the ProDOS File System INIT is in the System Folder. When in AFE, I can go to the menu and highlight AppleWorks to Microsoft Works as the translation, but it won't accept it. It appears to accept it, but only translates in the default mode. If the ProDOS File System INIT is taken out of the System Folder, AFE with Works-Works Transporter works fine.
This article has been archived and is no longer updated by Apple.
Apple File Exchange incorrectly assumes that the volumes it locates are Macintosh-readable. It isn't an issue with the Works-Works Transporter.

When AFE looks for the available volumes, it checks for the type of volume. When it finds a volume format not Macintosh-readable (that is, ProDOS or MS-DOS), then AFE displays an appropriate set of "to/from" menus for the volume format located.

The ProDOS File System INIT causes AFE to assume that the volume is Macintosh readable. Therefore, the volume doesn't appear to need translation from another operating system format. The same is true of similar INITs for MS-DOS volumes, such as AccessPC and DOSmounter.

The Macintosh foreign file system tools allow mounting the ProDOS and MS-DOS volumes on the Macintosh desktop. The INITs are the code segments that make this possible. When a volume is mountable on the Macintosh desktop, AFE considers it a Macintosh readable volume. This is an incorrect assumption for AFE to make.

Until Apple File Exchange is revised to allow mounting other volume formats on the Macintosh desktop, the only method of using AFE translation (beyondthe text-to-text mode) is to remove the ProDOS or MS-DOS file system INIT from the System Folder and restart the Macintosh. Then use AFE to perform the translation. To have the ProDOS or MS-DOS volume mountable on the desktop again, replace the file system INIT in the System Folder, and restart the Macintosh.

Final Cut Pro 4: Some Projects Created in Final Cut Pro 3 Take Longer to Open

Some projects created in Final Cut Pro 3 take significantly longer to open using Final Cut Pro 4.
This article has been archived and is no longer updated by Apple.
Projects containing DV media files captured using versions of Final Cut Pro prior to version 4 may take significantly longer to open. This is expected behavior.

When opening or importing DV media files captured with Final Cut Pro 1, 2, or 3 into Final Cut Pro 4, you may notice a slight delay for each file. This delay is due to Final Cut Pro 4 validating the audio sample rate of each media file to ensure that audio/video sync is maintained. DV media files captured using Final Cut Pro 4 have this adjustment applied during the capture process, and stored permanently in each media file.

This delay is different than the project updater that runs the when an earlier project file is opened in Final Cut Pro 4 for the first time.

Final Cut Pro 4 and Final Cut Express 2: Unusual keyboard shortcuts with some keyboards

Final Cut Pro 4 and Final Cut Express 2 may use nonstandard keyboard shortcuts for keyboard layouts of languages which are not available in the installed version of Final Cut Pro or Final Cut Express.
This article has been archived and is no longer updated by Apple.

Symptom

Standard Final Cut Pro or Final Cut Express keyboard shortcuts, such as those for the Zoom In Tool, Selection Tool, Toggle Windows and Toggle Wireframes, appear in menus to be linked to unusual or nonstandard keys.

This also can affect shortcuts such as Undo, Close Window, Select All, and Quit.

Products affected

- Final Cut Pro 4
- Final Cut Pro HD 4.5
- Final Cut Express 2.0

Solution

Final Cut Pro and Final Cut Express determine the default keyboard shortcuts based on the language that the computer is running in, for example only the default shortcuts for Belgian, French, Swiss French and other French language keyboard layout shortcuts are available when running Final Cut Pro or Final Cut Express in French.

As a partial workaround, create a custom keyboard layout using the Keyboard Layout options from the Tools menu. However it is not possible to reassign shortcuts to the key combinations to which the Undo, Cut, Copy, Paste and Abort are assigned.

Final Cut Pro 4: How to Name Clips Captured With "Capture Now"

Final Cut Pro 4 streamlines the capturing workflow by saving clips captured using the "Capture Now" feature directly to the Browser.
This article has been archived and is no longer updated by Apple.
After capturing a clip using the "Capture Now" feature, the clip is saved to the Browser and given a name based on the Description, Scene, and Shot/Take fields of the Logging tab in the Log and Capture window. The captured file on disk uses this same name. The checkboxes to the right of each field determine whether the information will be used as part of the filename.

If the fields are left blank, the clips in the Browser and the disk will be titled "Untitled", "Untitled1", "Untitled2", and so forth.

You can change a clip's name in the Browser by selecting the name and moving the mouse (or choosing Edit > Item Properties > Logging Info), but the filename on the disk will stay the same as when it was captured.

A/UX 2.0: Standard Toolbox Calls from within A/UX

Can you make calls to the standard toolbox from within A/UX? What books and other resources can help?

This article has been archived and is no longer updated by Apple.

The most important of the A/UX programmer's manuals is probably the A/UX Toolbox Macintosh ROM Interface, which details the Macintosh Toolbox calls that are available under A/UX.

Using this information, you need to decide what type of application you want. It is possible to write your application under the Macintosh OS in any of the development systems available to you there, as long as you take into account which Toolbox calls are available to you under A/UX. This would give you the added benefit of having your application run under both A/UX and the Macintosh OS.

The A/UX Developers Tools from APDA gives you the benefit of programming under A/UX, and this package includes a number of very useful tools designed specifically for A/UX development. This package is centered around an A/UX-compatible version of the Macintosh Programmer's Workshop, so if you are familiar with that package, you will be right at home. Note that applications written in this environment will not be able to run under the native Macintosh OS.

TA47687_AUX_Where_to_Find_GCC_Binary_(TIL09329).pdf

A/UX: Where to Find GCC Binary

Article Change History

08/31/92 - REVIEWED
* For technical accuracy

I need the executable code for A/UX 2.0.1 of the compiler GCC. This compiler is produced by Free Software Foundation, but they give the source code only. I can't compile it because cc, standard compiler of A/UX, is not ANSI. Please tell me if you have available the executable code of GCC, or send information of any other ANSI C compiler for A/UX 2.0.1.

This article has been archived and is no longer updated by Apple.
You have two options:

- You can order the A/UX Development Toolkit from APDA. This contains C89, which is an ANSI standard C compiler for A/UX. You could then use this to compile your source for GCC.

- You can obtain the A/UX GCC binary from any of the following Internet addresses: wuarchive.wustl.edu, afsg.Apple.com, aux.support.Apple.com.

Soundtrack: Score Markers Are Not Preserved Correctly

This document describes an issue that can occur if you add Score Markers to a DV50 23.98 clip and then export it from Final Cut Pro to Soundtrack.
This article has been archived and is no longer updated by Apple.

Symptom

Score Markers are not in the correct places.

This happens when a DV50 23.98 clip is edited in the Timeline, Score Markers are added, and the clip is exported from Final Cut Pro to Soundtrack.

Solution

Update to Soundtrack 1.1. The update can be obtained via the Software Update pane in System Preferences.

Published Date: Feb 18, 2012

iDVD: About the Four Stages of DVD Burning

This document describes the four stages of burning a DVD-R disc in iDVD.
This article has been archived and is no longer updated by Apple.
When burning a DVD-R disc, iDVD goes through four stages.

Stage 1 Preparing

Stage 2 Menu Rendering and Encoding

Stage 3 Asset Encoding

Stage 4 Multiplexing and Burning

The amount of time it takes for the disc to be created depends on the amount of video on the disc and the type of computer. On average, it takes two to four minutes to convert one minute of video into DVD format and write it to the disc. This means that on the first pass, an iDVD project that includes an hour of video may take up to 4 hours to burn to a DVD-R disc. If you are creating multiple discs, the second and subsequent discs will be created faster because iDVD only has to convert the video once.

Important: iDVD software may be used to reproduce materials. It is licensed to you only for reproduction of non-copyrighted materials, materials in which you own the copyright, or materials you are authorized or legally permitted to reproduce. If you are uncertain about your right to copy any material you should contact your legal advisor.

iMovie: How to Save Projects to Another Hard Disk

This document explains how to work with a hard disk other than your computer's startup disk in iMovie.
This article has been archived and is no longer updated by Apple.
If your computer's startup disk is low on disk space, you can use a secondary hard drive to save, back up, or archive your projects.

If you are creating a new project, simply select the secondary volume as the destination in the save dialog. If you do not see the disk in the destination list, click the disclosure triangle in the save window and scroll to the left to see all available volumes (see Figure 1).

Figure 1 Save dialog with multiple volumes

To copy an iMovie project to another disk:

1. Quit iMovie if it is open.
2. Locate the project folder in the Finder.
3. Drag the project folder to the other disk.

Note: You must move the complete project folder, intact, to the other disk in order to successfully copy the project. The project folder has the same name as the project listed in the iMovie window. This folder includes the iMovie project file, as well as a Media folder, which contains all of the clips associated with this project. If you don't copy all of these items, the project may no longer be readable in iMovie.

Once you have copied the project, try opening it in iMovie to ensure that it copied to the other disk successfully.

Important Considerations

Drive speed, bandwidth, and format are important when editing an iMovie project. Keep the following in mind when transferring a project to a volume other than the internal hard drive:

- Zip drives, floppy drives, hard drives connected via USB, and file server volumes are too slow to support direct editing of iMovie projects. These storage devices should only be used to back up and archive your projects.
- The drive must be formatted as Mac OS Extended (HFS Plus) or Mac OS Standard (HFS) format. Copying your iMovie project to disks that use DOS, UFS, or other formats may result in a project that is no longer useable in iMovie.
- When using drives connected to your computer with FireWire, connect the drive directly to the computer. If playback appears to stutter, or if iMovie indicates that the "disk responded slowly" consider disconnecting other FireWire devices.
- Disk fragmentation can cause playback issues within iMovie. If playback appears to stutter, or if iMovie indicates that the "disk responded slowly", consider defragmenting the disk using a defragmentation utility.

iPod for Windows: MUSICMATCH Jukebox Stuck At "Preparing to Synchronize"

The MUSICMATCH Jukebox can incorrectly report that the iPod is still in the process of synchronizing, even when the iPod has completely synchronized.
This article has been archived and is no longer updated by Apple.

Symptom

You see one of these two alert messages:

- "Preparing to synchronize IPOD with MM Jukebox. Please Wait..."
- "Operation Complete"

Note: The second message appears with a progress bar that is not complete.

This occurs even though the iPod has fully synchronized with MUSICMATCH Jukebox.

Solution

Click on the MUSICMATCH Jukebox Playlists icon, then click back on the iPod.

To prevent this in the future, do not select synchronize unless there have been changes to the MUSICMATCH Jukebox library or playlists.

Additional Information

This usually happens if you select synchronize when there has been no change since the last synchronization between MUSICMATCH Jukebox and the iPod.

LaserWriter IIg: Connecting to MS-DOS PC over Ethernet (5/97)

Is it possible to connect the LaserWriter IIg to an MS-DOS PC through Ethernet instead of through a serial connection?

This article has been archived and is no longer updated by Apple.

The only solution we are aware of is PhoneNET Talk from Farallon Computing,Inc. This is the successor to AppleShare PC, and it implements theAppleTalk protocol stack on an MS-DOS system. You would have to make surethat the Ethernet card used in the MS-DOS system is one of those supportedby PhoneNET Talk. There are a number of different cards supported, so youshould be able to find one to fit your needs.

Since both the LaserWriter IIg and PhoneNET Talk implement AppleTalk Phase2, you should have no difficulty communicating with the printer using thisproduct.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number..

Final Cut Pro 4: Multi-Channel Audio Interfaces Appear to Have Fewer Channels

Final Cut Pro 4 will work with most multi-channel audio interfaces that provide a Mac OS X driver. However, devices that report multiple streams instead of all channels in a single stream may need additional configuration in the sequence settings to work properly.
This article has been archived and is no longer updated by Apple.

Symptom

In the Audio Device Options window of the Audio/Video Settings, the number of audio channels available is fewer than the actual number of channels that the audio interface provides.

For example: A 10-channel audio card might report a separate stream for each channel, leading Final Cut Pro 4 to show the card as only being capable of a single channel.

Solution

This issue only affects the setup in the Audio/Video Settings window. If you set the sequence settings (choose Sequence > Settings and click the Audio Outputs tab) to support all the channels the device supports and configure the output map accordingly in the sequence settings, then all channels will be played to the device.

Note: With this setup, Final Cut Pro 4 will erroneously warn you that you have set up the sequence with more channels than the device actually has. This warning can be ignored.

Additional information

Final Cut Pro 4 works with most multi-channel audio interfaces that provide a Mac OS X driver. While Final Cut Pro 4 expects audio interfaces to report a single stream containing all available audio channels, some interfaces report multiple streams. At this time, the Audio/Video Settings window presents these devices as only being capable of the number of channels in the first stream.

Using the iPod Dock Connector to FireWire and USB 2.0 Cable

Learn how to connect the iPod Dock Connector to FireWire and USB 2.0 Cable to your iPod.
This article has been archived and is no longer updated by Apple.

About the cable

There are two versions of the iPod Dock Connector to FireWire and USB 2.0 Cable (sometimes referred to as a Y-cable or V-cable because of it's shape). The older model (order number M9126G/A) is 1.8 meters long and worked only with the iPod (with Dock Connector) model.

The new version (order number M9688G/A) is 1.15 meters long and works with iPod mini and all iPod models with a dock connector. The new cable also has this writing on the cable jacket:

"Designed by Apple in California Assembled in China•".

Besides the length and writing on the new cable, the two cables look the same and connect to the power adapter, iPod, and computer in the same way.

The iPod Dock Connector to FireWire and USB 2.0 Cable has three separate sections and connectors. See Figure 1. At one end of the cable is the dock connector. You connect it to iPod or to the iPod Dock. At the ends of the other two sections are a FireWire connector and a USB 2.0 connector. You connect them to the Apple iPod Power Adapter and your computer.

Figure 1 The iPod Dock Connector to FireWire and USB 2.0 Cable

Connecting to your computer with USB 2.0 (Windows-compatible computers only)

After connecting the dock connector to iPod or the iPod Dock, insert the USB 2.0 connector into one of the computer's USB 2.0 ports. Because USB does not supply iPod with power, you should also connect the FireWire portion of the cable to an Apple iPod Power Adapter. Connecting all three sections of the cable will allow you to manage the iPod music library from your computer and charge the battery at the same time. See Figure 2.

Figure 2 iPod connected to power adapter and computer

Connecting to your computer with FireWire

If your computer has a FireWire port, you can simply connect the FireWire portion of the cable to the computer and the Dock Connector portion to iPod (or the iPod Dock). You don't need to connect the USB 2.0 portion of the cable. This updates iPod with the music library on your computer and charges the battery at the same time.

Note: The FireWire port of some Windows-compatible computers may not supply power. In this case, you can:

- Purchase and install a FireWire card that supplies power.
- Connect iPod to a powered FireWire hub, then connect the FireWire hub to the computer's FireWire port.
- Fully charge iPod using the Apple iPod Power Adapter before trying to update the music library.
- Connect iPod to your computer's USB 2.0 port, if it has one, as described above in "Connecting to your computer with USB 2.0".

Important: Never connect both the FireWire and the USB 2.0 connector to your computer at the same time. Doing so can cause unexpected behavior.

System 7 RAM Disk: Macintosh Computers Supported

Which Macintosh computers support the RAM Disk feature of System 7.x?
This article has been archived and is no longer updated by Apple.
The following computers support the System 7 RAM disk:

- Macintosh IIvx
- Macintosh Centris 610
- Macintosh Centris 650
- Macintosh Centris 660AV
- Macintosh Color Classic
- Macintosh LC III
- Macintosh LC 475
- Macintosh LC 520
- Macintosh LC 550
- Macintosh LC 575
- Macintosh LC 630
- Macintosh Performa 410
- Macintosh Performa 450
- Macintosh Performa 460
- Macintosh Performa 466
- Macintosh Performa 467
- Macintosh Performa 475
- Macintosh Performa 476
- Macintosh Performa 550
- Macintosh Performa 600
- Macintosh Performa 630, 635, 636, 637, 638
- Macintosh Portable
- Macintosh Quadra 605
- Macintosh Quadra 630
- Macintosh Quadra 660AV
- Macintosh Quadra 700
- Macintosh Quadra 800
- Macintosh Quadra 840AV
- Macintosh Quadra 900
- Macintosh Quadra 950
- All Power Macintosh models which support System 7
- All PowerBook computers which support System 7

The RAM Disk feature was first built into the ROMs of the Quadra models, and subsequent models include this feature. Models without this code in ROM can't support the System 7.x RAM disk feature, and no software workaround is currently available.

Third-party software is available to provide this function for most Macintosh models. You can use shareware programs, like Ram Disk or AppDisk, available on most on-line services. Or you can purchase Maxima from Connectix. To locate a vendor's address and phone numbers, use the vendor name as a search string.

Note: The Assistant Toolbox extension in the PowerBook File Assistant saves the RAM disk contents between shutdowns.

Burning an audio CD in iTunes for Windows

Using iTunes for Windows, you can burn an audio CD with your computer's CD-R or CD-RW drive.
This article has been archived and is no longer updated by Apple.
If your computer has a CD-R or CD-RW capable drive, including some DVD-R and DVD+R drives, you can make or "burn" an audio CD using iTunes for Windows. If you're not sure what kind of drive your computer has, or if it can burn a CD, you can easily find out.

To burn an audio CD:

1. Open iTunes for Windows.
2. From the **Edit** menu, choose **Preferences**.
3. Click the Burning tab.
4. Select "Audio CD" as the disc format.

5. To have iTunes adjust the volume of the songs so they all play at the same level, click the checkbox labeled "Use Sound Check". This can be useful if your playlist has songs from different albums.
6. Click OK.
7. Select the playlist you want to burn to the CD. You can only burn a CD from the songs in a playlist.
8. Click the Burn Disc button, as shown here.
9. Insert a blank CD-R disc and click Burn Disc again.

Tip: If you plan on playing the CD in a home or car stereo CD player, use a blank CD-R disc. If you're only going to play the CD on your computer, you can use either a blank CD-R disc or a CD-RW disc.

Selected playlist and Burn Disc button

If you run into trouble burning an audio disc, read this informative article.

Blank CD-R discs are available from the Apple Store.

A note about copyright

iTunes software may be used to reproduce materials. It is licensed to you only for reproduction of non-copyrighted materials, materials in which you own the copyright, or materials you are authorized or legally permitted to reproduce. If you are uncertain about your right to copy any material, you should contact your legal advisor. See the iTunes Store Terms of Service for additional information.

Pers LW LS: Serialport Arbitrator/PrintMonitor Conflict (11/94)

I just installed Apple Remote Access. Now when I try to print to my Personal LaserWriter LS with background printing enabled, I get a message that there is "no LaserWriter available, please check the power and connections."

If I turn background printing off, it works fine. It also seems that everything runs fine if I remove the Serialport Arbitrator from the Extensions folder.

This article has been archived and is no longer updated by Apple.
This is a known conflict between the Serialport Arbitrator and PrintMonitor with the Personal LaserWriter LS. It occurs with system software version 7.0 or 7.0.1, and with the Personal LaserWriter LS driver version 7.0 or 7.1.

The only current workaround is to either disable background printing, or remove the Serialport Arbitrator, as you have already discovered.

Personal LaserWriter LS: Scaling Limits

I'd like to print to the Personal LaserWriter LS at 85% reduction, but only 50% and 75% are available. Is there a way to get reduction in print size, via the page layout, other than 50% and 75%?

This article has been archived and is no longer updated by Apple.
The current implementation of the Personal LaserWriter LS driver is limited to the 25% reduction increments, and there is no way to modify this.

A possible workaround is called DynoPage, by Portfolio Systems, Inc. In addition to reduction options, it allows double-sided printing and printing to any page size. It can be extended to user-specified page layouts.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

Final Cut Pro 4: High Quality Option Doesn‘t Appear in RT Pop-Up Menu

The high quality option does not appear in the Timeline's RT pop-up menu on all computers for all video formats.
This article has been archived and is no longer updated by Apple.
On some PowerPC G4-based desktop and portable computers, the high quality option only appears in the Timeline's RT pop-up menu if the computer's microprocessor is fast enough to perform real time effects at high quality (Figure 1). The computer's microprocessor speed and the selected video format determines if the option appears or not.

Figure 1 High quality option selected in RT pop-up

Note: When a sequence is rendered, playback to a video device is always at "high" quality, even if the RT pop-up menu does not indicate that option.

Minimum requirements for the RT pop-up menu to display the High Quality option:

Mac OS X 10.3 Panther

- DV25 30fps:
  - Desktop at 500 MHz
  - PowerBook at 667 MHz
- DV50 30fps:
  - 800 MHz with cache
  - 1 GHz no cache
  - Any dual-processor computer

Mac OS X 10.2 with QuickTime 6.4

Moving your MUSICMATCH songs into your iTunes Library

Learn how to move songs from MUSICMATCH into your iTunes for Windows Library.
This article has been archived and is no longer updated by Apple.
When you first start iTunes, you are given the option to search for music to add to the iTunes library. If you did not select this option, follow the steps below to add music to iTunes.

To move songs from MUSICMATCH into the iTunes Library:

1. Open iTunes.
2. Open your "My Music" folder by clicking the **Start** button and then pointing to **My Music**.
3. Arrange the windows so you can see both the My Music folder, and the iTunes Source list.
4. Drag your MUSICMATCH songs from the My Music folder to the Library in the Source list.

Dragging your music files to the iTunes Library

Tip: The My Music folder is the default location for your MUSICMATCH songs. If you have moved the songs to another location, drag them from there instead. If you're not sure where your MUSICMATCH songs are located, use the following steps to find out.

1. Open MUSICMATCH.
2. From the **Options** menu, choose **Settings**.
3. Click the Recorder tab.
4. Click the Tracks Directory button. The full path of the music library is located at the top of the window.

iTunes will synchronize music and audiobooks to your iPod. You can continue to use MUSICMATCH Jukebox and Audible Manager, but they will no longer transfer content directly to your iPod. Any content you want to sync with your iPod should be imported into iTunes.

If your MusicMatch playlists are on the same computer as iTunes, you can import them into the iTunes Source list. From the **File** menu, choose **Import**, then locate the playlists that you want copied into iTunes. iTunes can import playlist files ending with .m3u, .txt, or .xml.

iTunes for Windows: Ellipsis Appears as as Black Box

Black boxes appear in iTunes for Windows in place of the ellipsis character (...).
This article has been archived and is no longer updated by Apple.

Symptom

If you upgraded to Windows 2000 from Windows 98, the default font may still be set to MS Sans Serif, which does not have the ellipsis character.

This happens when the system font is set to MS Sans Serif.

Solution

Use "Display Properties" to change the system font to one that includes the ellipsis character, such as the Tahoma font.

1. Click the **Start** button, then point to **Control Panel**.
2. Click Display.
3. Click Appearance.
4. From the Item pop-up menu, choose Menu, then from the Font pop-up menu, choose Tahoma (Figure 1).
5. From the Item pop-up menu, choose Message Box, then from the Font pop-up menu, choose Tahoma.
6. From the Item pop-up menu, choose Selected Items, then from the Font pop-up menu, choose Tahoma.
7. From the Item pop-up menu, choose Tool Tip, then from the Font pop-up menu, choose Tahoma.

Final Cut Pro 4: Compressor - Droplets May Require Movies Have Filename Extensions

Droplets created with Compressor may not recognize movies unless they have a filename extension such as ".mov".
This article has been archived and is no longer updated by Apple.

Symptom

The droplet does not highlight when you drag a movie file icon on it.

Solution

There are two options to use the droplet:

Option 1

1. Rename the movie to include the filename extension ".mov". Example: "newmovie.mov".
2. Drag the renamed file to the droplet.

Option 2

1. Double-click the droplet.
2. Drag the movie to the Source File section of the Droplet window (Figure 1).
3. Click the Submit button.

Figure 1 The Source File section of the Droplet window.

Final Cut Pro 4: Stops Responding When Rendering Non-DV Clip With QuickTime 6.4

Reinstall QuickTime 6.3 if Final Cut Pro stops responding when you render a clip.
This article has been archived and is no longer updated by Apple.

Symptom

Final Cut Pro stops responding when you render a clip that doesn't use the DV codec. The cursor turns into a progress indicator (looks like a colored pinwheel).

This may occur most frequently when you render clips from LiveType because LiveType uses the Animation codec instead of the DV codec.

Solution

Download and install the Final Cut Pro QuickTime Render Plug-in

This is available in document 120263 "**Final Cut Pro QuickTime Render Plug-in**".

Published Date: Feb 18, 2012

Keynote 1.1.1: About the "MS Comic Sans Error" Message

Reselect the Blackboard theme in Keynote 1.1.1 if the alert, ""MS Comic Sans Error" appears.
This article has been archived and is no longer updated by Apple.

Symptom

An alert appears with the text "MS Comic Sans Error".

This happens when you open a file that uses the Blackboard theme.

Solution

Reselect the Blackboard theme.

1. From the **File** menu, choose **Choose Theme**.
2. Click the Blackboard theme.
3. Click the Choose Theme button.

iPod Software Updater for Windows: "Can‘t Mount iPod" Message

If Windows is installed on a volume other than the C drive, the message "Can't Mount iPod" may appear.
This article has been archived and is no longer updated by Apple.

Symptom

The message "Can't Mount iPod" appears.

This happens when you try to install or restore using the iPod Software Updater for Windows.

Products affected

- iPod
- Microsoft Windows

The following are not affected by this:

- iPod mini Software 1.0 and later
- iPod Software version 2.x
- iPod Software 2004-04-28 and later

Solution

This occurs if Windows is installed on a different volume than the C drive. Windows should be installed on the C drive. **Note**: This will only occur with iPod Software Updater versions 1.x.

For help installing Windows, contact your computer manufacturer or Microsoft.

Published Date: Feb 18, 2012

iPod for Windows: Long Delay Accessing Songs in iPod

iTunes for Windows version 4.1.1 resolves an issue that could cause slow performance on an iPod.
This article has been archived and is no longer updated by Apple.

Symptom

After syncing music to an iPod using iTunes for Windows version 4.1, iPod starts up slowly.

iPod may skip the selected song and play the next one.

Solution

1. Download and install iTunes 4.2 for Windows from the iTunes website: (**http://www.apple.com/itunes/download/**).
2. Restart the computer when prompted to do so.
3. Perform a full Restore of the iPod using the latest version of the iPod Updater that is available for your iPod--version 2.1 for iPod (with Dock Connector) and version 1.3 for previous iPod models. Both versions are available from **http://www.apple.com/ipod/download/**.
4. Sync your music to the iPod using iTunes 4.2.

DAL Server: For MVS to Access IBM DB-2 Database (11/94)

I have an IBM 3090 Mainframe running virtual memory and MVS. The database of choice is DB-2. Do you have a DB-2 DAL Server that runs on a 3090 running MVS and virtual memory?

This article has been archived and is no longer updated by Apple.

You need Data Access Language Server for MVS/TSO or the server for MVS/V TAM. These products provide support for DAL-based applications using data residing in the IBM DB-2 or Teradata DBC/1012 databases. They work with existing DB-2 databases, operating under standard MVS and database security.

DAL Server for MVS/TSO v1.3 supports MVS/XA release 2.2 or greater, DB-2 release 1.3 or greater, and Teradata DBC/1012, v4.1 or later. It also supports access via Apple's MacDFT along with Apple's Coax/Twinax, TokenTalk NB, or Serial NB cards. You can use TriData's Netway 1000 or 2000, Avatar's MacMainFrame, and DCA's MacIrma hardware and software products in place of Apple's 3270 products listed above. It also supports a synchronous connection via protocol converters.

The DAL Servers for MVS/TSO and MVS/V TAM are available through APDA.

To locate a vendor's address and phone number, use the vendor's name as a search string in the Tech Info Library.

iTunes for Windows: iTunes Store Window Is Blank

You may not be able to access the iTunes Store if you're using Web acceleration software.
This article has been archived and is no longer updated by Apple.

Symptom

When you click iTunes Store in the Source list, the main part of the iTunes window turns white and remains blank.

This happens if you are using Web accelerator software.

Solution

Download and install iTunes for Windows 4.2 or later.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Document 17159, "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

iPod Software 1.3.1 Updater Installs iPod 1.3 Software on iPod

The iPod Software 1.3.1 Updater is for Mac OS X 10.3 compatibility and installs iPod 1.3 software.
This article has been archived and is no longer updated by Apple.
iPod Software 1.3.1 Updater installs the same software as iPod Software 1.3 Updater. The only difference is that iPod Software 1.3.1 Updater is compatible with Mac OS X 10.3, and iPod Software 1.3 Updater is not. If you don't have Mac OS X Panther, you don't need to use iPod Software Updater 1.3.1.

After using iPod Software 1.3.1 Updater, iPod's About screen will still read version 1.3, not 1.3.1. You can update to the latest version of the iPod software using Software Update or clicking the links below.

iPod (with touchwheel and scroll wheel)
Download iPod 1.3 for Windows and iPod 1.3.1 for Mac OS X.

iPod (with Dock Connector)
iPod 2.1 for both Mac OS X and Windows is available from the iPod Download page.

PATHWORKS 1.0 & PageMaker: Printing through VAXshare Issue

I'm using PATHWORKS 1.0. I have difficulty printing PageMaker documents, especially ones with complex graphics, when using VAX/VMS print queues to spool Apple LaserWriter printers. I suspect this has something to do with the Aldus Prep PostScript dictionary file not being passed to the printer by PATHWORKS. Is there a workaround?

This article has been archived and is no longer updated by Apple.

VAXshare Print Services in PATHWORKS is a component developed by Digital. Digital Customer Support Center (CSC) in Atlanta confirmed that they are aware of this problem, and that they already escalated it to Digital engineering.

QuickTime VR Authoring Studio: How to Install With Final Cut Pro or DVD Studio Pro 2

If you have installed Final Cut Pro 4 or DVD Studio Pro 2, you may not be able to install QuickTime VR Authoring Studio.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to install QuickTime VR Authoring Studio, this message appears:

> "Installation on the active startup disk 'Macintosh HD' cannot take place while another application is running. Please quit 'compressord' and try again."

Solution

Restart the computer, then install QuickTime VR Authoring Studio.

The process "compressord" runs in the background and starts when you use the Compressor application included with Final Cut Pro 4 and DVD Studio Pro 2. Restarting the computer quits the process and allows you to install QuickTime VR Authoring Studio.

Use a Smart Playlist to make regular backups of your music in iTunes

This article has been archived and is no longer updated by Apple.

You can use a Smart Playlist in iTunes to make regular, incremental backups of your music, videos, and spoken word media (audio books).

If you have an optical drive that can burn a CD or DVD, you can make regular backups of your iTunes library including music, audiobooks, and movie files.

To make an initial backup of your library, follow the steps outlined in "How to back up your library in iTunes 5 or 6" or "iTunes 4: How to Back Up Music".

Once you have backed up all of your existing iTunes library, take note of the date and time you completed the backup and then continue with the following steps.

Create a playlist of content you've added since your last backup

1. Open iTunes.
2. From the **File** menu, choose **New Smart Playlist**.
3. Configure the Smart Playlist so that it includes all content with a Date Added that is after the date of your last backup.

4. Click OK.
5. Name the Smart Playlist something like "Backup Playlist".

Burn a backup disc of all the files you have added since your last backup

1. Open iTunes.
2. Open iTunes Preferences.
   - Mac OS X: From the **iTunes** menu, choose **Preferences**.
   - Windows: From the **Edit** menu, choose **Preferences**.
3. Click Advanced (iTunes 5 or later).
4. Click Burning.
5. Click Data CD or DVD.
6. Click OK.
7. Select Backup Playlist in the Source list.
8. Click Burn Disc.
9. Insert a blank disc. If you have added more files since your last backup than can fit on one disc, iTunes can burn them onto two or more discs.
10. When iTunes finishes burning the disc, eject it and write the current date on it.

Next time you do a backup

1. Open iTunes.
2. Select the "Backup Playlist" in the Source list.
3. From the **Edit** menu, choose **Edit Smart Playlist**.
4. Change the date to the date you wrote on your last backup disc and repeat steps 1 through 10 above.

Only want to backup purchased files?

If you only want to backup content you purchased from the iTunes Store, you can configure the Smart Playlist to only look at the Purchased Content playlist as shown here:

Then follow the burn a backup steps above.

Restoring files from backup:

To add music files back into your iTunes library from your backup discs:

1. Insert the disc into your computer. The disc shows up in iTunes.
2. Click the disc in the Source list.
3. Click the Browse button in the upper right to make browsing the disc easier.
4. Locate the songs, albums, artists, videos, audiobooks, or entire genres you are missing.
5. Drag the missing files to Library in the Source list.

Soundtrack: Score Markers Imported Incorrectly

When importing a clip with multiple score markers, Soundtrack may mix up the markers.
This article has been archived and is no longer updated by Apple.

Symptom

When importing a clip with multiple score markers into Soundtrack, the score markers appear to be mixed up. For example, marker 1 is where marker 2 should have been, marker 2 is where marker 3 should have been, and so forth.

Solution

Update to Soundtrack 1.1. Soundtrack updates can be found in Software Update preferences or at the Soundtrack download page (http://www.apple.com/soundtrack/download/).

Final Cut Pro 4: Media End Point Is Incorrect After Recapturing 29.97 Video Into 23.98 Sequence

Learn how to address inaccuracies caused by recapturing 29.97 video into a 23.98 sequence.
This article has been archived and is no longer updated by Apple.

Symptom

An inaccurate calculation results in the Media End point for each clip, giving it an earlier timecode.

This can happen when using Media Manager to create a new 23.98 offline project from an existing 23.98 project and capturing clips in the new 23.98 offline project at 29.97 fps and then applying the Remove Advanced Pulldown option to this 29.97 media.

Solution

1. Select the affected clips in the Browser.
2. From the **Modify** menu, choose **Make Offline**.
3. Select the option to "Leave Them on the Disk" and click OK.
4. From the **File** menu, choose **Reconnect Media**.
5. In the Reconnect window, locate the clips on disk and click Choose.

This document will be updated as more information becomes available.

iTunes for Windows: "Service for importing and burning CDs and DVDs has not been started" Message

Learn how to start the service for importing and burning CDs and DVDs if you see a message that says it hasn't been started.
This article has been archived and is no longer updated by Apple.

Symptom

This message appears when you open iTunes:

> "Warning! The iTunes service for importing and burning CDs and DVDs has not been started. Please restart the service to enable burning and importing."

Solution

Update to iTunes for Windows 4.2 or later, available from the iTunes download page.

If you're not able to update, follow these steps to have the GEARSecurity service start up automatically:

1. Quit iTunes.
2. Right-click My Computer. (In Windows XP, My Computer appears in the Start menu.)
3. From the shortcut menu that appears, choose **Manage.**
4. Expand the entry for Services and Applications by clicking the plus sign.
5. Click Services in the Computer Management window.

6. Right-click the GEARSecurity in the Services list.
7. From the shortcut menu that appears, choose **Properties**. This message appears: "The specified device instance handle does not correspond to a present device."
8. Click OK.
9. Make sure **Automatic** is chosen in the "**Startup type**" pop-up menu.

10. Click Start.
11. Click Apply. This message appears: "The specified device instance handle does not correspond to a present device."
12. Click OK.
13. Open iTunes.

Final Cut Pro and Final Cut Express: How to Stop Capturing After Disk Full Message

Change your scratch disk location to avoid a disk full message in Mac OS X 10.3.
This article has been archived and is no longer updated by Apple.

Symptom

While using Capture Now in Final Cut Pro or Final Cut Express, the following message appears:

> "Your startup disk is almost full. You need to make more space available on your startup disk by deleting files."

After clicking OK, pressing the Esc (Escape) key does not stop the capture as usual.

Solution

To avoid the issue in the future, update to Final Cut Pro HD. To address the issue immediately, follow the steps below.

To end the capture

1. Click the Final Cut Pro or Final Cut Express icon in the Dock, or click one of the application's menus (such as File or Edit).
2. Press the Esc key.

To prevent this issue from occurring in the future, choose a scratch disk other than your startup disk.

To change the scratch settings

1. Open Final Cut Pro or Final Cut Express.
2. From the **Final Cut Express** menu, choose **Preferences**, or from the **Final Cut Pro** menu, choose **System Settings**.
3. Click the Scratch Disks tab.
4. Choose a different volume for your scratch disk.

This document will be updated as more information becomes available.

Lexar Media Memory Stick USB Reader
Memorex USB Dual Card Reader
SmartDisk Reader for Memory Stick
SmartDisk MemoryStick Reader
SmartDisk CompactFlash Reader
Sony MSAC-US1 (Memory Stick)

All cameras are USB 1.x unless otherwise noted. Additional cameras may be supported. Non-USB digital still cameras that use CompactFlash, Memory Stick, MultiMedia Card (MMC), SecureDigital (SD) and SmartMedia cards are supported when the memory card is used with a supported media reader. While most media readers are MSC-compliant and will "just work", some media readers may require additional drivers to be installed in order to work with Mac OS X. Native ("RAW") picture formats may require additional software.

Notes:

(1) FireWire (IEEE 1394a) interface.

(2) USB 2.0, will work at 1.x speed when connected via a USB 1.x port.

(3) Requires Mac OS X v10.2.2 to work in default mode. Will work with any version of Mac OS X when set to PTP mode.

iTunes for Windows: Unable to Burn MP3 CD, Data CD, or DVD

You might not be able to burn an MP3 CD, data CD, or DVD with Spanish, Swedish, or Finish versions of Windows 2000 or Windows XP.

This article has been archived and is no longer updated by Apple.

Symptom

One of the following occurs:

- iTunes for Windows unexpectedly quits when you click Burn.
- iTunes for Windows does not recognize audio CDs.

This happens with the Spanish, Swedish, and Finnish versions of Windows 2000 and Windows XP when you try to burn an MP3 CD or data CD or DVD. It doesn't happen when you burn an audio CD.

Solution

Update to iTunes 4.6 or later.

Soundtrack: Don‘t Use Same Name For Loops and One-Shots

Saving a One-shot recording with the same name as a previously recorded Loop replaces the Loop with the One-shot.
This article has been archived and is no longer updated by Apple.

Symptom

When you record and save a couple of tracks as Loops and name them "Take 1" and "Take 2", for example, then record two other tracks and save them as "One-shots" with the same names as the Loops, the "One-shot" tracks replace the "Loop" tracks.

Solution

Don't use the same name for the tracks. Consider adding additional descriptions, for example "take 1 loop" or "take 1 1shot".

This document will be updated when additional information is available.

DAL: Third-Party Servers

I want to put servers on Apollo and Ultrix-based VAX workstations so Macintosh computers can access the data there. I need a list of current DAL servers.
This article has been archived and is no longer updated by Apple.
The following are available from APDA:

Data Access Language Developer's Toolkit
Data Access Language Server for VAX/VMS (9 track format)
Data Access Language Server for VAX/VMS(TK 50 Format)
Data Access Language Server for VM/CMS
Data Access Language Server for MVS/TSO
Data Access Language Server for A/UX v1.3
Data Access Language Server for MVS/VTAM v1.3

Since you're looking for a DAL server for Ultrix and Apollo UNIX, the answer is very likely to come from Pacer.

Here is the latest information from the DAL Product Manager:

- Pacer Software announced a DAL Server for HP/UX, and DAL Server for SunOS on Sun SparcStation. Transport methods are TCP and Asynchronous. Databases supported are Ingres, Oracle, Informix, and Sybase.

They also have plans for DAL Server for Ultrix, and DAL Server for RS/6000 platform in early 1992.

- Novell is shipping on a DAL Server for Netware.

- Tandem is currently shipping DAL Server Tandem.

- Data General is working on a Server Product. Please contact directly for expected shipping date.

- Blyth Software is shipping DAL Toolkit for MS/DOS. AttachMate Software is required.

DVD Studio Pro 2: Black Frame Appears Between Menus in Simulator

When moving between menus or between menus and video tracks on a simulated disc, a black frame may briefly appear.
This article has been archived and is no longer updated by Apple.

Symptom

A black frame appears between menus or between menus and video tracks when using the Simulator.

Solution

This only happens with the Simulator. Build the title and play back from a DVD Player to preview the disc.

This document will be updated when additional information is available.

Published Date: Feb 18, 2012

DVD Studio Pro 2: Importing and Saving an iDVD Project Rewrites the Project File

If you import an iDVD project into DVD Studio Pro 2, save the DVD Studio Pro project using a different name.
This article has been archived and is no longer updated by Apple.

Symptom

iDVD can't open a project. This happens after you imported the project into DVD Studio Pro 2.

Solution

To prevent this from occurring, save the project using a different name. In DVD Studio Pro, choose **Save As** from the **File** menu.

This document will be updated when additional information is available.

Published Date: Feb 18, 2012

DVD Studio Pro: Audio and Video Duration Are Not the Same in Asset Container

Because audio and video have different frame sizes, the durations will not be exactly the same.

This article has been archived and is no longer updated by Apple.

When you import a movie, the audio and video are listed separately in the Asset container. The Length column in the Asset container may show that the duration of the audio for the movie is one frame longer than the video. This is normal and occurs because audio and video have different frame sizes.

iPod (With Dock Connector): Image Capture Unexpectedly Quits While Importing Photos

Image Capture may unexpectedly quit when importing photos from an iPod whose name includes Japanese characters or an apostrophe.
This article has been archived and is no longer updated by Apple.

Symptom

Image Capture unexpectedly quits while importing photos from iPod.

Solution

Use iPhoto instead of Image Capture to import photos or rename the iPod so it does not include the following characters:

- Apostrophe (')
- Japanese characters

See technical document 60952, "**iPod: How to Rename Your iPod**", if you need help renaming your iPod.
Published Date: Feb 18, 2012

DVD Studio Pro 2: Missing Assets Do Not Automatically Relink While the Project Is Open

Missing assets must be relinked in DVD Studio Pro 2.
This article has been archived and is no longer updated by Apple.
If your project has missing assets, their names, and the names of any elements that use them, are red in the Assets and Outline tabs (Figure 1). This can happen if the assets are on an external hard disk that isn't turned on or connected to your Mac, for example.

Once the assets are available, their names in the Assets tab turn black, and can be relinked. If the assets don't automatically relink themselves, relink them manually using the pop-up menu in the Assets tab or by clicking on the individual element in the Outline tab to bring up the Relink dialog. Alternatively, you can close and reopen the project.

Figure 1 Missing asset appears in red
Published Date: Feb 18, 2012

DVD Studio Pro 2: Display Profile Affects Color of Assets on Burned Discs

The colors you see in your DVD Studio Pro 2 project are affected by the Display Profile you choose in Display preferences.
This article has been archived and is no longer updated by Apple.
If you are using more than one computer to build a specific project, make sure to choose the same Display Profile in Display preferences. The best choice is probably Generic RGB Profile. Using different profiles could cause a disc burned on one computer to have different colors than the same project burned on another computer.

Follow these steps on each computer you use for a specific project::

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **Displays**.
3. Click Display.
4. From the **Colors** pop-up menu, choose **Millions**.
5. Click Color.
6. Select the Generic RGB Profile.
7. Quit System Preferences.

Published Date: Feb 18, 2012

DVD Studio Pro 2: Slideshows Created in iDVD Drop Zones Only Display the First Slide When Imported

If you import an iDVD project that contains a drop zone with a slideshow for the asset, DVD Studio Pro will only import and display the first slide in the drop zone.

This article has been archived and is no longer updated by Apple.

Symptom

The Drop Zone asset is empty.

Solution

Create a QuickTime movie of the slideshow, import and set it as the drop zone asset in iDVD or DVD Studio Pro 2.

Published Date: Feb 18, 2012

DVD Studio Pro 2: Projects Not Fully Previewed in iDVD Do Not Import Properly

When a menu has never been opened or rendered in iDVD, the information in the project file is not complete and DVD Studio Pro will not import the drop zones.
This article has been archived and is no longer updated by Apple.

Symptom

Menus are missing backgrounds and button shapes in an iDVD project you imported into DVD Studio Pro 2.

Solution

To ensure all iDVD menu elements import correctly into DVD Studio Pro, navigate to each chapter index menu in iDVD before saving the project. This is also true for any menus you add to your iDVD project by clicking the Folder button.

DAL 1.3: Use With Different Oracle Process Names

I tried to install DAL 1.3 for ORACLE V6 on a VAX/VMS system for an evaluation period. In the installation manual it says that the ORACLE V6 processes should have the following names: ORA_DEMO_RMON, ORA_DEMO_SMON. I can't imagine a lot of sites using these names for the ORACLE processes of their production database. In the installation notes I couldn't find the necessary commands to type if you have other ORACLE process names, in order to get DAL to work. Can you give me some guidelines? The VMS process names in this particular case are: ORA_CIT_RMON, ORA_CIT_SMON.
This article has been archived and is no longer updated by Apple.
When you install ORACLE 6.x, you are asked to name an SID for the instance. An SID is an instance's unique identifier. It's a one-to-size character that identifies the new instance. Oracle uses this SID in the names of the processes associated with that instance.

These names, however, don't change the way you start DAL to use ORACLE. The examples in the Installation Guide used the name DEMO, but you can use any SID you like.

On the VAX, you still use "idal" to try a connection to the ORACLE demonstration database.

The example you saw in the Installation Guide shows you how to check for ORACLE DBMS status. No matter what your SID name is, you still use the $ SHOW SYS command. These four processes should be in the list output by SHOW SYS.

If this doesn't work, access these tables using ORACLE's SQLPlus to see if it works. If it doesn't, check your ORACLE installation, startup procedure, and privileges of the account you are using.

By the way, DAL 1.2 and 1.3 have problems with Oracle 6.0.33 (6.0.32 and before are OK) because ORACLE stops defining the logical name SYS$ORACLE, which we need for DAL to work. To get around this, you can define the logical name for them in the MSAD$LOGICALS file. You should define SYS$ORACLE to be the value "ORA_RDBMS" and then things should work.

The symptom for this is subtle. You can open up the DBMS, but any attempt to open up a database causes the connection to go away. So it looks like it might be a networking or AppleTalk for VMS problem. It's actually the DAL server dying, because it assumes that value exists when it doesn't.

iTunes 4: Optical Drive Support For Mac OS X

iTunes 4 supports optical drives that work with Mac OS X.
This article has been archived and is no longer updated by Apple.
Optical drives that work with Mac OS X work with iTunes 4. Apple does not publish a list of supported optical drives. However, Apple will often add support to Mac OS X and its updates shortly after optical drives are released by third-party manufacturers.

Apple puts a high priority on supporting optical drives that are sold at the Apple Store (online and retail). There may be some lag time between when Apple starts selling a new optical drive and when a Mac OS X update is released that adds support for it. In the meantime, you may want to check the drive manufacturer's website to see if a driver that supports Mac OS X is available.

If you have updated Mac OS X to the latest version available through Software Update, and Apple System Profiler doesn't show that the drive can be used to burn discs, check the drive manufacturer's website to see if a driver is available.

Document 17159, "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

DVD Studio Pro: About Markers in MPEG Encoded With DVD Studio Pro 2

The markers in MPEG files encoded with DVD Studio Pro 2 do not work with earlier versions of DVD Studio Pro.
This article has been archived and is no longer updated by Apple.

Symptom

Chapter markers do not appear in earlier versions (1.0 through 1.5.2) of DVD Studio Pro when importing MPEG files encoded with DVD Studio Pro 2.

Solution

You can manually add the markers to the files if you want to import them into the earlier version of DVD Studio Pro.

Published Date: Feb 18, 2012

DVD Studio Pro 2: Single Layer Shape Files Are Not Supported

If you import a shape file that has a single layer, a gap appears in the Palette where the shape should appear, and you cannot select the shape or delete it in DVD Studio Pro.
This article has been archived and is no longer updated by Apple.

Symptom

An imported shape file is completely invisible, unusable, undeletable, and has no visible name. Attempts to replace it are not successful.

Solution

All shape files you import must have at least two layers.

To delete a single layer shape file, do one of the following:

If the shape was not imported as a project-only shape

1. Click the Finder icon in the Dock.
2. From the **Go** menu, choose **Go to Folder**.
3. Type: `/Library/Application Support/DVD Studio Pro/Shapes`
4. Click Go.
5. Drag the specific shape file to the Trash.

If the shape was imported as a project-only shape

You only have to delete the original shape file from its original location. When a shape is imported as a project-only shape, a reference is added to the project, defining the shape's location.

Published Date: Feb 18, 2012

DVD Studio Pro 2: Mask Edges May Be Visible in Shapes You Create

If you make the thumbnail image mask layer (the first layer) of a shape the same size as the shape's graphics layer (the second layer), you may see some of the mask layer around the edges of the graphics layer.
This article has been archived and is no longer updated by Apple.

Symptom

Drop Zones have a small white fringe around the shape

Solution

This occurs because the shape's graphics layer is processed differently than the mask layer. You can work around this issue by making the mask layer slightly smaller than the graphics layer.

This document will be updated when additional information is available.

Published Date: Feb 18, 2012

iMovie 4: Some Titles Plug-ins Require at Least 16 MB of Video Memory

Your computer must have at least 16 MB of video memory (VRAM) to use all the plug-ins in the Titles pane.
This article has been archived and is no longer updated by Apple.
Computers that normally work with iMovie 4 must also have at least 16 MB of video memory in order to use the Twirl, 3D Spin, and the Far Far Away plug-ins in the Titles pane. If your computer doesn't have enough VRAM, these plug-ins won't appear in the Titles pane.

Additional requirements for iMovie can be found in technical document 93598 "**iMovie 4: System Requirements**."
Published Date: Feb 18, 2012

QuickTime 6.3: Installs on Top of Mac OS X Systems With Later Versions of QuickTime

The QuickTime 6.3 installer for Mac OS X does not warn you that you are installing on top of a later version of QuickTime.
This article has been archived and is no longer updated by Apple.
If you accidentally installed QuickTime 6.3 on top of a later version (including QuickTime 6.4 or 6.5), download and install the later version again.
It's available from the QuickTime Download webpage (http://www.apple.com/quicktime/download).

This document will be updated when additional information is available.

Final Cut Pro 4J: Exporting Text Generator to XML

When using the Japanese version of Final Cut Pro 4.1, if you use the text generator without selecting a font, the default font is encoded improperly and results in invalid XML.
This article has been archived and is no longer updated by Apple.

Symptom

Final Cut Pro will not import the XML.

Solution

Make sure you select a font in the text generator controls before exporting the project as XML.

This document will be updated when additional information is available.

Published Date: Feb 18, 2012

AppleWorks: Envelope Assistant Uses Wrong Font Size

AppleWorks may create text with a larger font size than the one you selected in the Envelope Assistant.
This article has been archived and is no longer updated by Apple.

Symptom

If you choose a small font size (9- or 10-point) in the Envelope Assistant, AppleWorks creates text with a 72-point font size.

Solution

To change the font size of all the text in the document:

1. From the **Edit** menu, choose **Select All**.
2. From the **Text** menu, choose **Size**, then choose the correct font size.

This document will be updated as more information becomes available.

DVD Studio Pro 2: QuickTime Missing Assets Search Dialog Reappears After Being Canceled

The QuickTime Missing Assets search dialog reappears after being canceled if you can't find a reference QuickTime movie (one that relies on a master movie for its content).
This article has been archived and is no longer updated by Apple.

Symptom

The QuickTime Missing Assets search dialog reappears after being canceled.

Solution

The dialog will appear three times. Click cancel each time the dialog appears to dismiss it.

This document will be updated when additional information is available.

Serial Printer: Connecting to UNIX Host Via Ethernet

I would like to print to our LaserWriter IINT via Ethernet from an SCO UNIX 3.2 computer. Is there a driver available to do this? Can this work for an ImageWriter II as well?

This article has been archived and is no longer updated by Apple.
You can connect a LaserWriter IINT to a UNIX host with very little difficulty. But since the LaserWriter IINT has no Ethernet port, it's going to be very difficult to connect it directly to an Ethernet network.

You can, however, connect the LaserWriter IINT to a UNIX host via a serial connection. Then use the UNIX print spooler to allow other UNIX hosts on an Ethernet to print to the serially connected printer. You could use Adobe Systems' Transcript software to allow PostScript printing from the UNIX host. Or you could put the printer into Diablo 630 emulation mode and use it just like any ASCII printer.

You can connect the ImageWriter the same way. Of course PostScript style output would not be available, so the Transcript software won't be necessary.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

QuickTime 6.5: Localized Menus Are in English

The menu items and dialogs will be in English if you install some localized versions of QuickTime 6.5 for Windows over an English version.
This article has been archived and is no longer updated by Apple.

Symptom

QuickTime for Windows menus and dialogs appears in English.

This occurs after installing the localized Chinese (Traditional and Simplified) or Korean version of QuickTime 6.5 for Windows on a computer where an English version of QuickTime for Windows was already installed.

Solution

Remove the English QuickTime for Windows version before installing the localized version of QuickTime for Windows.

See technical document 60342, "**QuickTime: How to Uninstall QuickTime on a Windows-Compatible Computer**," for steps to remove the English version of QuickTime.

This document will be updated when additional information is available.

AppleTalk Remote Access: How to Copy It to an 800K System

I have a PowerBook 140, with AppleTalk Remote Access. I want to use this copy of Remote Access (on 1.4MB diskette) in my Macintosh SE, which has 800K diskettes. How can I get a copy of Remote Access on 800K diskettes if I have a version on 1.4MB diskettes? Do I have to buy a copy?

This article has been archived and is no longer updated by Apple.

The license accompanying AppleTalk Remote Access allows a single user to make up to three copies of the AppleTalk Remote Access software for use on Apple computers they own and/or operate. You don't need to purchase another copy for your Macintosh SE.

To get a copy of the software for your Macintosh SE, (800K, two disks) we recommend the following:

- Get a copy from your dealer.

- Copy the software to your PowerBook 140 and then do a "Live Install" on your Macintosh SE, over the network. The procedure below assumes you have an AppleTalk network in place between the PowerBook 140 and Macintosh SE, either with LocalTalk cabling, PhoneNet cabling, or serial cable (not supported by Apple).

1) Insert the AppleTalk Remote Access 1.4MB floppy into the PowerBook.

2) Drag the Floppy Disk icon on top of the Hard Disk icon. This creates a folder on the PowerBook 140 called "Installer" with all of the AppleTalk Remote Access software within.

3) Open the Installer folder.

4) Rename the application inside from "Installer" to "Install".

5) Drag the files "Install" and "Remote Access Script" out of the Installer folder, to the root level of the hard disk (not the desktop).

6) Turn on File Sharing on the PowerBook.

7) From the Macintosh SE, use the Chooser to connect to the Macintosh PowerBook server. Sign on as the PowerBook owner. This gives you access to the entire PowerBook hard drive (that is, the PowerBook hard drive icon will appear on the Macintosh SE desktop).

8) From the Macintosh SE, open the PowerBook hard drive icon.

9) From the Macintosh SE, you should be able to see the "Install" application. Double click on it.

DAL: Defining Oracle Image Identifier

I have several instances of Oracle installed on my system. How does DAL know which one to look at?
This article has been archived and is no longer updated by Apple.
The DAL Oracle database adapter, as supplied, is linked with the Oracle Image Identifier "S". If your installation selected a different image identifier, two assign statements must be supplied in either the system login file or the user's login file to point DAL to the correct Oracle images:

- Oracle 5.1.22

$assign/nolog device:[directory]ORACLEx.EXE ORACLES
$assign/nolog device:[directory]ORACRTLx.EXE ORACRTLS

where "x" is the Oracle Image Identifier.

- Oracle 6.0

$assign/nolog device:[directory]ORACLEx.EXE ORACLES
$assign/nolog device:[directory]ORACRTLx.EXE ORA_CRTLS

where "x" is the Oracle Image Identifier.

iMovie 3: Cannot Print Tutorial

The iMovie 3 tutorial materials may not print to some PostScript printers.
This article has been archived and is no longer updated by Apple.

Symptom

When you print the iMovie 3 tutorial PDF files, the job spools to the print queue, but never prints. The printer may report a PostScript error.

Solution

Use one or more of the following methods to print the tutorial material:

- Print the tutorial to a non-PostScript printer (such as an inkjet printer).
- Print the tutorial material from Adobe Reader instead of Preview. You can find the tutorial PDF files on your computer's hard disk. Choose **Go to Folder** from the Finder's **Go** menu, type "/Library/Documentation/iMovie/", click Go and locate the files you want to print.
- Download and print the iMovie 4 tutorial materials instead. Please note that some features presented in the iMovie 4 tutorials are unavailable in iMovie 3 . The iMovie 4 tutorial PDF files are available at the bottom of the iMovie support webpage.

iLife ‘04: Cannot install from CD or DVD

Find out what you can do if your computer doesn't work with the iLife '04 CD or DVD.
This article has been archived and is no longer updated by Apple.
When you try to open the iLife '04 installer on the iLife '04 Install CD:

- An alert appears that says the computer contains a DVD drive and that you must install iLife from the install DVD.
- If you try to install iLife from the DVD as instructed, the computer ejects the DVD as unreadable disc.

The solution is to install the components individually as follows:

1. Insert the iLife '04 install CD.
2. In the Install CD window that appears, select the iLife installer package icon in the Finder.
3. From the **File** menu, choose **Show Original**.
4. In the window that appears, locate the following items:
    - iMovie.pkg
    - iPhoto.mpkg
    - iTunes4.pkg
5. Open each of the individual installers listed above to install each item that is part of the iLife package.

LaserWriter IIg: Configure for Twisted Pair Ethernet (5/95)

My Apple LaserWriter IIg does not appear in the Chooser. When I send a print job to the printer, the green light on the transceiver flashes, but the job times out and isn't printed.

I swapped the suspect Apple LaserWriter IIg with a known good one and had the same problem.

This article has been archived and is no longer updated by Apple.
Check the push button switch on the back of the LaserWriter IIg, make sure it is set to 0 (zero) for AppleTalk Ethernet networks.

Also it appears you are connecting an Apple Twisted Pair Transceiver to a Farallon PhoneNet EN transceiver via RJ-45 cabling. Although the boxes are physically compatible, they are not logically compatible. The Apple Twisted Pair Transceiver is 10BaseT-compliant, but the Farallon PhoneNET EN is not.

The Apple Twisted Pair Adapter (part number M0845) is not the correct part. You need to use an Apple Ethernet AUI Adapter and power supply (part number M0432).

Here is the configuration:

Macintosh IIcx with 3Com EtherLink card -----> Farallon PhoneNET EN -----> Farallon StarController EN (via RJ-45 cable) -----> Farallon PhoneNET EN (via RJ-45 cable) -----> Apple Ethernet AUI Adapter (M0432) -----> Power Supply and Apple LaserWriter IIg.

Article Change History:
04 May 1995 - Added the push-button switch informaiton.

Final Cut Express 2: Video stops at a still frame in an exported movie

When your sequence has gaps or blank areas, the video in an exported movie stops playing on the first frame of the clip after the gap, but the audio keeps playing. If your sequence begins with a blank area, the audio plays but there is no video (the video is black).
This article has been archived and is no longer updated by Apple.
To get the audio and video to play together drag a Slug effect into the Timeline from the Video Generators folder in the Effects tab of the Browser and edit it into the Timeline wherever there is a gap in video.

Upgrade to Final Cut Express 2.0.3 or later to avoid the need to use a Slug.

Note: A Slug is a video clip of a black image with an empty pair of audio tracks. Use it as a placeholder in areas where you want to keep a gap between two clips.

A/UX: How to Back Up Installation Floppies

Article Change History

08/31/92 - REVIEWED
* For technical accuracy.

How can I use A/UX to make backup copies of my installation media? The floppies don't have Macintosh file systems on them, so regular Macintosh backup programs don't work.

This article has been archived and is no longer updated by Apple.
To clone an A/UX installation floppy, follow these steps:

1) Give the command:

dd if=/dev/floppy0 of=/tmp/floppy.image

This creates a file containing a copy of the floppy disk contents on the A/UX file system.

2) Insert the duplicate floppy and type:

dd if=/tmp/floppy.image of=/dev/floppy0

to move the copy of the A/UX file system to the new floppy.

As an alternative, you can make the backup copies under the Macintosh OS using a program like DiskCopy.

Tips for charging iPod and connecting to your computer

Follow these tips if you have trouble charging iPod or connecting it to your computer or if you receive an alert that states: "A HI-SPEED USB device is plugged into a non-HI-SPEED USB hub".
This article has been archived and is no longer updated by Apple.

- It's best to connect your iPod or iPod mini directly to your computer's Hi-Speed USB 2.0 or FireWire (IEEE 1394) port. Check here for information on Mac OS X computers using USB 2.0. Avoid connecting it to a hub or another device that is connected to the computer.
- If you connect iPod or iPod mini through a hub, make sure it is a powered hub. **Important**: A USB keyboard acts like a hub, but is not powered.
- If you are using a Hi-Speed USB or FireWire hub and you are not sure if it's powered, check with the manufacturer.
- The FireWire ports on some Windows-compatible computers may not be powered, which means they can't charge iPod or iPod mini. A port that only accepts a 4-pin cable is not powered.
- If you experience any issues using the ports on the front of the computer then try using the Hi-Speed USB ports on the back of your Windows-compatible desktop computer.
- Using the cable that came with the iPod, connect it directly to the iPod Power Adapter.

DVD-R discs you burn in iDVD 4 or DVD Studio Pro 3 may not play in Mac OS 9

Apple DVD Player in Mac OS 9 may not recognize or play the DVD-R discs you burn in iDVD 4 or DVD Studio Pro 3.
This article has been archived and is no longer updated by Apple.
As a workaround, try holding the Command-Option-I keys simultaneously when you insert the DVD-R disc. Keep holding the keys down until the DVD disc appears.

Holding these keys down forces the computer to make the disc available on the Desktop as an ISO 9660 format disc instead of a UDF formatted disc.

Note: If the disc has a DVD-ROM section containing a high number of items, the disc may take a little while to appear.

This document will be updated as more information becomes available.

AWS 95 & A/UX: Not Booting - "yp: server not responding"

I have configured my A/UX system for bnet. When the system asked me if I wanted to be a NIS client, I respond with yes. Now, it does not boot.
This article has been archived and is no longer updated by Apple.
When an A/UX system is configured to be a Yellow Pages client, it tries to connect to a Yellow Pages server during the boot process. If it cannot find a server, it displays the message yp: server not responding and the system waits until one becomes available.

One way to disable Yellow Pages is from the startup shell, by typing:

```
mv /etc/ypbind /etc/ypbind.hold
```

Then continue to boot normally. Once you have booted, we suggest that you turn off Yellow Pages in /etc/inittab and move the file back to the original location. To turn off Yellow Pages, find the line that executes ypbind and set it to off.

Another way is to edit the file /etc/inittab, using the ed editor from the A/UX Startup application.

Here is the process:

1) Launch A/UX Startup and click Cancel as it begins to launch A/UX.

2) At the startup# prompt, type: `ed /etc/inittab`

3) Use standard ed editing commands to change the line:

```
.  nfs2:2:wait:/etc/ypbind
```

- to -

```
.  nfs2:2:off:/etc/ypbind
```

NOTE: For help with the ed editor, read the manual, "A/UX Text Editing Tools."

DAL 1.2: Fix for AppleTalk Connections Dropping

I am running DAL 1.2 on a VAX and my AppleTalk connections occasionally drop into a mutex state. When AppleTalk for VMS drops into this state, I can't make a connection to DAL.
This article has been archived and is no longer updated by Apple.
This is a known problem with DAL and a patch is available on tape to fix the problem. To get a copy of the patch:

- Apple SEs should contact Tech Comm.
- Apple customers should contact the DRC.

Tip: Delete encoded assets after updating to iDVD 4.0.1

If you have a dual processor Power Mac G5 computer, or if you have encountered any issues with your iDVD 4 projects, delete the encoded assets after updating to iDVD 4.0.1.
This article has been archived and is no longer updated by Apple.
Follow these steps for each project you created with iDVD 4.0.

1. Open the iDVD project.
2. From the **Advanced** menu, choose **Delete Encoded Assets**.
3. From the **File** menu, choose **Save Project**.

These steps help ensure that your project's material will be encoded and burned utilizing the benefit of the iDVD 4.0.1 update.

How to Set up a Claris Folder

What is the Claris folder inside my System Folder?
This article has been archived and is no longer updated by Apple.

A Description of the Claris Folder

Nearly all Claris applications can use the Claris XTND System for import & export of other file types. (XTND is also Claris Translators.) The Claris dictionaries are also used by nearly all Claris applications and are available in four languages in addition to US English.

This quick reference guide shows you how to set up a Claris folder in your System Folder. This allows all of your Claris applications to share the same Claris Translator files, as well as Claris dictionary files, saving space on your hard disk.

MacDraw Pro (1.0 or 1.5) and Claris Resolve (1.1) will automatically create a Claris folder and install the files which they use. They will not, however, install all of the files you may need.

Before You Install

Make sure you have access to the most recent versions of the Claris software.

Installing files into the Claris folder:

1. Open the System Folder.
2. Create a folder called Claris -with exactly those characters. Claris Folder, Claris, or even putting spaces around Claris will cause Claris applications to FAIL to locate the folder.
3. Copy the Claris Translators folder from the MacWrite II Reference disk into the Claris folder.
4. Copy the Claris XTND System file to the Claris folder. (This file enables the Claris Translator folder.)
5. Copy the Main Dictionary and User Dictionary to the Claris folder.
6. Copy the Claris Help System to the Claris folder.
7. Copy any applicable help files to the Claris folder.

Help files come with all Claris products except MacPaint 2.0.

(Please remember that you need both the "Claris Help System" file, as well as any of the above help files.)

Claris Translators also work with ON Location 2.0.1 and Instant Update 1.0.1

Installing foreign language dictionaries:

Foreign Language Dictionaries are currently available for Claris applications in: British, French, Spanish, and German.

To install a foreign language dictionary:

1. Drag the appropriate dictionary and hyphenation files into the Claris folder. (Each foreign language dictionary has a separate hyphenation file.)
2. In your Claris application, choose Install Dictionaries ╔ (From the Spelling menu in MacWrite II, from the Check Spelling hierarchical menu under the Edit menu in FileMaker Pro, Claris CAD and MacDraw Pro.)
3. Select the appropriate dictionary in the dialog box which appears. You're ready to begin spell checking!

Stationery/Options Documents:

A. Changing Default Settings:

In MacDraw Pro 1.0 & 1.5, MacWrite II 1.1, Claris CAD 2.0, and MacProject II 2.5; you can change any of the default settings such as: fonts, fonts sizes, headers, footers, custom styles (MacWrite II) rulers, pen sizes, artwork (MacDraw Pro 1.0 & 1.5, Claris CAD) and save them as a Stationery document. From now on, each time you open the specified application or create a new document, all of the customized settings will be the default settings. The following procedure explains how this is done.

1. Select New from the File menu.
2. Change any of the default settings to those you routinely use. (i.e., customize the menus, change the pattern palette, etc.)
3. Add any graphics, such as a letterhead or logo, that routinely appear in your documents.
4. Choose Save As from the File menu.
5. Type in the filename "<application name> II Options" and click Stationery. (<Application name> equals one of the following: MacWrite

II Options, MacDraw Pro Options, Claris CAD Options, etc.)
6. Select either the System Folder, or the Claris folder within the System Folder, or the folder that contains the given Claris application as the folder in which you want to save this file.
7. Click Save.
8. Choose quit from the File menu.

B. Temporarily Disabling Your Custom Default Options:

1. Hold down the option key while starting the given application and it will not look for your startup file in the System Folder. OR ...
2. When choosing New from the File menu in your application, hold down the option key. This will bring up a blank document.

Specific Application Notes

MACWRITE II 1.1: Using MacLink Plus Bridge

MacWrite II users can order an additional set of file translators containing many more PC and mainframe application file formats from DataViz, Inc.

In order to use the additional translator files, follow the installation procedure below:

1. Copy the MacLink Plus Bridge file from the MacWrite II Program disk into either the Claris folder, or the Claris Translators folder.
2. If present, the DataViz MacLink Plus/Translators file should be in the Claris folder. PLEASE NOTE: IF THE MACLINK PLUS/TRANSLATORS FILE IS IN THE CLARIS TRANSLATORS FOLDER, IT WILL NOT BE READ.

To see the full range of XTND filters in MacWrite II

If the Open and Save As dialog boxes in MacWrite II do not display all the XTND filters in the pop up menu, try doing an "Insert File" (command-shift-i). Typically, this option will show all the XTND filters available when the pop-up is clicked.

FileMaker Pro/MacDraw Pro: Additional Claris Translator files

In order to ensure that these new versions can read and write needed file formats, make sure the Claris Translators files from the FileMaker Pro/MacDraw Pro disks are copied into your Claris folder, as well as the Help documents, if you wish to use help inside these applications.

Claris Translator Files

(Excludes MacLink Plus/Bridge files purchased from DataViz, as well as native formats, such Stationery, Text, Tab Text, Comma Separated Text, etc.)

(Also excludes ClarisWorks translators, which are a single 100K file, version 1.0v3; and Claris Resolve translators, which reside inside the application.)

Claris XTND file 1.3
Acta 3.0 (1.0)
AppleWorks (1.0)
AppleWorks GS (1.0)
Claris XTND Bridge (1.0)
EPSF (1.0v3) (Encapsulated Postscript File)
MacDraw II 1.1 (1.0v4)
MacLink Plus/Bridge (2.0)
MacPaint (1.0v2)
MacPaint 2.0 (1.0v2)
MacWrite (1.0)
MacWrite 5.0 (1.0v3)
MacWrite II (1.0)
Microsoft Word 3.0 (1.0)
Microsoft Word 4.0 (1.0v2)
Microsoft Word PC (1.0v2)
Microsoft Works 1.1 (1.0v2)
Microsoft Works DB (1.0v2)
PICT (1.0)
Plain Text (1.0)

RTF (1.0v2) (Rich Text Format)
TIFF (1.0v2) (Tagged Image File Format)
WordPerfect (1.0)
WordPerfect PC 4.2 (1.0v2)
WordPerfect PC 5.0 (1.0v4)
WriteNow (1.0v2)
WriteNow NeXT (1.0)

If you don't want to use the Claris folder

There are several other options for you if you don't want to create a Claris folder in your System Folder. Although the Claris folder approach is recommended, here are some alternatives:

- The Claris Translators folder in the root(top) level of the System Folder.
- The Claris Translators folder in the same folder as MacWrite II 1.1.
- Claris Application (Stationery) Option Files: Select either the System Folder, or the folder that contains the given Claris application, as the folder in which you want to save this file.
- Main Dictionary and User Dictionary files: the folder that contains the given Claris application as the folder in which you want to save this file.
- Help System and Help Document files: the folder that contains the given Claris application as the folder in which you want to save this file.

Apple IIe Card: Control Panel vs. Option Panel

How do the Macintosh Control Panel and the Apple IIe Option panel relate to each other?

This article has been archived and is no longer updated by Apple.
They are separate. Printers, keyboard, mouse, and other Macintosh settings have no effect on the IIe side. The only setting that affects the IIe Option Panel is the Monitors setting in the Macintosh. If the Macintosh is set to black and white, the Apple IIe Card only displays black and white data.

iTunes: How to backup and restore playlists

Learn how to back up and restore your playlists.
This article has been archived and is no longer updated by Apple.

Backing up playlists

Follow these steps:

1. Open iTunes.
2. Select one of your playlists from the Source list.
3. From the **File** menu, choose **Export Song List**. A Save dialog appears.
4. From the **Format** pop-up menu, choose **XML**.
5. From the **Where** pop-up menu, choose **Desktop**.
6. Click Save.
7. Repeat steps 2 through 6 for each of the playlists that you have created in iTunes.

Note: These smart playlists are created automatically by iTunes, so you do not need to back them up:

- 60's Music
- My Top Rated
- Recently Played
- Top 25 Most Played.

Restoring playlists

Follow these steps:

1. From the **File** menu, choose **Import**.
2. Navigate to and select one of the exported playlist files on your Desktop.
3. Click Choose.
4. Repeat steps 1 through 3 for each of the playlist files that you have exported to the Desktop.

Important: Some playlist information, such as Play Count and Last Played date, is not preserved.

For steps to recreate the iTunes library file see "iTunes: How to recreate your iTunes Library."

iDVD 4 processes reported incorrectly as hung in Activity Monitor

It can be handy to use Activity Monitor to check the status of iDVD 4 and its processes while encoding and burning a project to disc in iDVD 4. However, if you open iDVD after Activity Monitor is already running, you may notice that ThumbnailServer and EncoderServer (which are processes of the iDVD 4 application) are listed in red and are labeled as being hung.
This article has been archived and is no longer updated by Apple.

They are actually running normally. If you quit Activity Monitor and open it again while iDVD is already open, those processes will be listed accurately.

iMovie 4: Vertical lines in still image

Still clips may display as black and white vertical lines in your iMovie 4 project.
This article has been archived and is no longer updated by Apple.
The project would look similar to this:

If you are experiencing the issue, the solution is:

1. Open your project in iMovie.
2. Insert a DV or Ken Burns still clip at the beginning of your project as a placeholder.
3. Delete the affected still clip.
4. Import once again the original photo used for the still clip.
5. Reapply any transitions or effects to the reimported still image if needed.
6. When finished editing, delete the clip added in step 2.

To prevent this from occurring with new projects insert a DV clip or Ken Burns still image as the first clip of your project. You can delete this clip after you are finished editing your project.

This document will be updated as more information becomes available.

About the iPod Updater

This article has been archived and is no longer updated by Apple.

Apple provides a single updater for all iPod models. The updater installs the latest software appropriate for your iPod. For example, the "iPod Updater 2006-01-10" will install the lastest iPod software available as of January 10th, 2006. The latest iPod Updater can be downloaded from http://www.apple.com/ipod/download/.

To verify which software version the updater installs, first open iPod updater, then:

On a Mac:

- From the **iPod Updater** menu, choose **About iPod Updater**.

In Microsoft Windows:

- Right-click on the iPod Updater window's title bar.

Note: The Universal iPod Updater does not necessarily enable the same features on all iPod models; some features such as voice recording and photo importing are model-specific.

Note: In Mac OS X, the Software Update version of the iPod updater may have a different version number than software that is installed. In the picture below, version 3.0.2 is the version of the automatic updater which includes several different versions of iPod software. See above for information on what version of iPod software is installed on different iPod models.

Frequently Asked Questions about iPod Updater

Starting with iPod Updater 2006-01-10, iPod Updater has some new changes and improvements.

How can I tell if I am using the latest iPod Updater?

The date is in the name of the application. For Macintosh, iPod Updater 2006-01-10 and later has:

- A Help menu that links to the iPod Support page and Register iPod page. If you don't see this menu, you are not using the latest version.
- An improved user interface that tells you more about the iPod you're using.
- Better integration with iTunes.
- A Preferences menu to quickly quit the Updater and open iTunes.

Is iPod Updater supported on Macs with Intel Core Processors?

Yes, iPod Updater 2006-01-10 (and later) is a Universal Binary and is supported on Mac OS X 10.2.8 or later on Macs with a PowerPC or Intel Core Processor. Like previous iPod Updaters, it can be used to update all iPod models, dating back to the original iPod.

Known issues

- Updating or restoring the original iPod (dock connector) via USB is not supported. Use FireWire to update this iPod. (The updater reminds you of this.)
- After you update or restore an iPod and quit to launch iTunes, there may be a delay before the iPod appears in iTunes. If it doesn't show up in iTunes, check the iPod's screen to see if it is still updating its firmware or just wait a few minutes.
- The new Updater requires Mac OS X 10.2.8 or later. If you are using an older version of Mac OS X, check the support downloads area to download the iPod Updater 2005-11-17, which is supported on Mac OS X 10.1.5.

- With older iPod models that require you to connect your iPod to power to complete the Update or Restore:
  - If you select the preference to always quit after update/restore, you may not see the message that explains to connect your older iPod to power to complete the restore.
  - After you restore, you may see a message that your iPod was updated. It is in fact restored.
  - In rare instances, if you update or restore but ignore the quit dialog and wait until your iPod has appeared in the Finder, when you do quit, iTunes won't recognize iPod. If this happens, simply quit iTunes and open iTunes again.

Published Date: Feb 18, 2012

Quit iPod Updater 2004-04-28 before opening iTunes

iTunes may not recognize an iPod while iPod Updater is open, even if it appears on the Desktop in the Finder (Mac OS X) or in Windows Explorer (Windows)

This article has been archived and is no longer updated by Apple.

If iTunes is already open when you quit the iPod Updater, just quit and reopen iTunes.

iMovie can no longer export to camera after installing Final Cut Pro HD or Final Cut Express HD

After installing Final Cut Pro HD or Final Cut Express HD, you can no longer use iMovie to export to a DV camera connected via FireWire.
This article has been archived and is no longer updated by Apple.
You may see the following alert:

> **Lost connection to camera.**
> iMovie lost the connection to the video camera. please check the connections and try again.

This can happen with iMovie 3 or iMovie 4. This does not occur with iMovie HD 5.0.

The solution is to temporarily move the following files from /Library/QuickTime/ to the Desktop:

Final Cut Pro HD

- DesktopVideoOut.component
- DVCPROHDVideoOutput.component

Final Cut Express HD

- DesktopVideoOut.component

Restart the computer and try exporting from iMovie to your camera.

When you need to use Final Cut Pro HD or Final Cut Express HD again, drag these files back to /Library/QuickTime/ and restart the computer.

TA47841_Thumbnail_shows_deleted_frame_in_iMovie_and_.pdf

Thumbnail shows deleted frame in iMovie 3 and 4

The thumbnail image in the clip viewer is the same as it was before you trimmed the first frame.
This article has been archived and is no longer updated by Apple.
This can occur in iMovie 3 or iMovie 4 after you do the following:

1. Drag a movie clip from the Clips pane to the Clip Viewer.
2. Trim off the beginning of the clip in iMovie monitor.
3. Empty the iMovie Trash.
4. Quit iMovie.
5. Open iMovie and open the same project.

Even though the thumbnail shows the incorrect frame, the movie plays back and exports correctly.

Tip: This symptom does not occur if you don't empty the iMovie Trash.

Apple IIe Card: Sound Level Control

How do I control the Apple IIe Card sound level?

This article has been archived and is no longer updated by Apple.
You can control sound either from the Macintosh side or from the Apple IIe Card software:

- From the Macintosh Control panel, you can slide the speaker volume control from seven (loudest) to zero (silence), thus altering the volume of the beep.

- From the Apple IIe Card Option panel, you can change the type of "beep" the computer makes, but you cannot change the volume level.

Neither the Macintosh nor the Apple IIe Card can control the sound(s) that an application makes. For example, computer and card panel settings will not affect a music program or a game's sound effects.

Published Date: Feb 18, 2012

iTunes 4: Spanning multiple discs requires Mac OS X 10.2 or later

When you try to burn a playlist that contains an audio book file that is too large to fit on one audio CD, the burn does not begin. You get this alert message from iTunes:
This article has been archived and is no longer updated by Apple.
"None of the items in this playlist can be burned to disc."

This can happen with iTunes 4 and Mac OS X 10.1.5.

The solution is to break the audio book file into segments when burning, as discussed here.

A note about copyright

iTunes software may be used to reproduce materials. It is licensed to you only for reproduction of non-copyrighted materials, materials in which you own the copyright, or materials you are authorized or legally permitted to reproduce. If you are uncertain about your right to copy any material, you should contact your legal advisor. See the iTunes Store Terms of Service for additional information.

Finding the Final Cut Express 2 registration number

The 11-digit registration number for Final Cut Express 2 is located on the front page of the booklet titled "Installing Your Software", as shown here.

This article has been archived and is no longer updated by Apple.

This number is required when you call AppleCare Technical Support.

Important: The registration number is different from the software serial number you use to activate and serialize your professional software product. Both the registration number and software serial numbers are important. Keep them in a safe place for future reference.

Final Cut Express includes 90 days of free telephone support, which includes help installing and opening your Apple Professional Software Product, and with basic troubleshooting.

Note: In the United States, Canada, Europe and Japan, Apple products come with 90 days of free telephone support. In other countries, availability of support, duration of the complimentary support period, telephone numbers, and hours of operation may vary and are subject to change. Telephone call charges may apply.

Disk Copy 4.2: How to Install and Use (2/97)

Article Last Reviewed: 12 February 1997

Disk Copy 4.2 is a utility program that transfers image files onto 3.5-inch floppy disks, whether 800K or High Density. (A High Density, also called FDHD, disk holds 1.44MB.)

This article has been archived and is no longer updated by Apple.

Increasing Memory Allocation (for High Density images)

If you are reading High Density images, follow these steps to increase the memory allocation for Apple Disk Copy to 1600K:

Step 1:
Select the Apple Disk Copy 4.2 icon.

Step 2:
From the File menu, choose Get Info (or press Command-i).

Step 3:
In the Current Size box, type 1600.

Step 4:
Close the Get Info window.

Step 5:
Launch Apple Disk Copy 4.2 and proceed with Step 3 in the following section, "Apple Disk Copy 4.2: Installation and Use".

Apple Disk Copy 4.2: Installation and Use

To install and use Apple Disk Copy 4.2, follow these steps:

Step 1:
Copy the Disk Copy 4.2 folder to your hard drive.

Step 2:
Open the Disk Copy 4.2 folder and double-click the Disk Copy icon.

Step 3:
The title screen appears; click the mouse to continue.

Step 4:
The main screen appears; click the Load Image File... button. (You can also select Load Disk Image from the File menu or press Comand-L.)

Step 5:
Choose the image file you want to copy to floppy disk.

Step 6:
Click the Open button. A message appears: "Reading the master disk image into memory..." After the image is loaded into memory, the Make A Copy button is highlighted.

Step 7:
Click the Make a Copy button and a prompt appears: "Please insert a disk to COPY ONTO..."

Step 8:
Insert a floppy disk (formatted or unformatted) into the main floppy drive. This message appears: "Now copying and verifying a disk..."

If there is already data on the disk, a beep sounds and a dialog box appears. If it is okay to write over the disk, click the Duplicate button. Otherwise, click the Eject button. If you eject the disk, the main screen reappears. Click the Make A Copy button again and insert a different disk.

When the image file has been transferred to the floppy disk, the disk automatically ejects.

Step 9:

For each image file you want to put on floppy disk, repeat steps 4-8. When you are finished, click the Quit button. (You can also select Quit from the File menu or press Command-Q.)

Hints and Help

To launch Apple Disk Copy 4.2 and load the image file into memory at the same time, double-click the image file icon.

If you want to learn more, read the "Disk Image Directions" document in the Apple Disk Copy 4.2 folder.

Other Disk Copy Features

--Making copies directly from a floppy disk. To copy the contents of a master disk onto one or more other disks, take the following steps:

1) Choose Single Copy or Multiple Copies from the File menu.

2) Insert a master floppy disk to copy from into the floppy disk drive.

3) Click Read Master Floppy to read the contents of the master disk.

4) When the image file is loaded, click Make A Copy to start copying. (If you are making multiple copies, this button is labeled Make Some Copies.)

5) Insert a blank disk in the floppy disk drive to receive the newly created disk contents. When the wristwatch pointer changes back to the arrow pointer, disk creation is complete. If you are making multiple copies, insert each blank disk in turn.

--Creating an image file for later use
You can store an image file on your hard disk and use it to create duplicate floppy disks. Follow these steps to put an image file of a floppy disk on your hard disk:

1) Insert the floppy disk that you want to duplicate into the floppy disk drive.

2) Click Read Master Floppy.

3) After the contents of the floppy disk have been read, choose Save Disk Image from the File menu.

4) In the window provided, give the image file a name, and click Save.

Before Installing System 7.1

This quick reference shows you what to do before installing System 7.1 software. It includes:

- Backing up your hard disk
- Running Compatibility Checker
- Updating hard disk drivers
- Where to get more information

This article has been archived and is no longer updated by Apple.

Backing Up Your Hard Disk

Back up your entire hard drive. If you can't do this, at least make a backup copy of your System Folder. To do this:

1) Click the System Folder once to select it.

2) From the File menu, choose Duplicate or press Command-D.

3) Save the duplicate System Folder to another hard disk, to floppies, or to tape backup as an added measure of security.

Running Compatibility Checker

Compatibility Checker 2.0 is a stand-alone application. To run it, simply do the following:

1) Copy the Compatibility Checker 2.0 application to your hard disk.

2) Double-click the Compatibility Checker icon to launch the application.

3) The Welcome window appears. Click the continue button at the bottom right side of the window.

4) A dialog box appears with a listing of currently available disks marked by selected check boxes. Click the OK button if you want Compatibility Checker to scan all of your hard disks, otherwise click the check boxes to deselect any hard disk(s) you do not want to scan. Compatibility Checker scans your hard disk. Progress is marked by a modal dialog box, similar to the Copy dialog box in the Finder

5) If Compatibility Checker finds potentially incompatible items, a screen appears.

6) Click one of the two buttons at the bottom of the screen. If you click the Move button, the items will be moved to a folder on top level of the hard disk named "May Not Work With System 7.1." In either case, the Compatibility Report window will appear.

7) Use the Sections menu, as shown below, to navigate around the report. (It's best to print the report and use it as a guide to update your software if necessary.)

8) When you're finished with Compatibility Checker, click the Quit button. A dialog box appears, asking if you want to save the report.

9) After you've chosen whether or not to save the report, the a dialog box appears, notifying you that any items Compatibility Checker moved out of your System Folder are still active until you restart your Macintosh.

10) Review the report, following the instructions detailed in it. Remember, individual vendors are the best sources of information, please contact them directly if you have any questions.

Checking Hard Disks With Disk First Aid

Disk First Aid can detect and repair any issues that your Apple supplied hard disk(s) might have before installing system 7.1. Specifically, Disk First Aid 7.1 can detect and repair any occurrence of the "disappearing folders and files bug" which System 7 Tune-Up prevents, but cannot repair. Previously, the only course open to users was to re-initialize their hard disk.

1) Disable any virus or security software.

2) Start up with the Disk Tools disk. To do this, turn on your Macintosh. If your Macintosh is already on, select Restart from the Special menu.

3) Put the Disk Tools disk in the main floppy drive right after you hear the chime. The Disk Tools disk icon appears in the upper right corner of the desktop.

If disk icon does not appear, select Restart from the Special menu. The disk will eject, simply pop it back into the drive immediately.

4) Double-click the Disk Tools icon. A dialog box appears.

5) Double-click the Disk First Aid icon. A dialog box appears.

6) Click the Drive button in dialog box to select your (first) hard disk. Click the Open button. A Disk First Aid window appears.

7) Click the Start button. If no problems are found, the message: "This disk is OK" appears. Skip to step #9.

8) If damage was found, click the repair button. When repairs are completed, go to step #10. If repairs are unsuccessful, you'll need to back up the disk, then re-initialize the disk with HD SC Setup.

9) Repeat for any additional hard disks. Choose Open from the File menu and repeat steps #5 through #7.

10) Choose Quit from the File to return to the Finder.

Updating Hard Disk Drivers

Drivers are small programs that tell your hard disk how to interact with your Macintosh. You must update these drivers on your Apple hard disk(s) before installing System 7.0. To update your drivers, follow these steps:

1) Disable any virus or security software.

2) Start up with the Disk Tools disk. To do this, turn on your Macintosh. If your Macintosh is already on, select Restart from the Special menu.

3) Put the Disk Tools disk in the main floppy drive as soon as you hear the chime. The Disk Tools disk icon appears in the upper-right corner of the desktop -- if it doesn't, select Restart from the Special menu. When the disk ejects, pop it back into the drive immediately.

4) Double-click the Disk Tools icon.

5) Double-click the Apple HD SC Setup icon.

6) Click the Update button. A message appears.

7) Click the Quit button.

You are now ready to install System 7.0 software. Refer to the "Quick Reference: How to Install System 7.0" for instructions.

How to Connect to File Servers

This article gives basic instructions on how to work with file servers or "shared disks" as they are also called. Its topics include:

- Connecting to file server (shared disk)
- Logging on as a guest
- Logging on as a registered user
- Setting your password
- System 7.0 hints and help
- Where to get more information

This article has been archived and is no longer updated by Apple.

Connecting to a File Server (Shared Disk)

Follow these steps to connect to a file server:

1. From the Apple menu, select Chooser. The Chooser window appears.
2. Click the AppleShare icon in the upper-left part of the Chooser window.
3. Scroll the list of AppleTalk Zones to find the one you want.
4. Click the name of the AppleTalk Zone to select it. A list of shared disks (also called file servers) in that zone appears in the right-hand window.
5. To select a shared disk, click its name.
6. Click the OK button (or you can double-click the shared disk name, which does the same as steps 5 and 6).
7. Click the Guest or Registered User radio button. Read the instructions that follow for the radio button you've chosen.

Logging on as a Guest

If Guests are allowed to log on, the word Guest appears in regular type. If Guests are not allowed, the word Guest appears dimmed (grayed out). Follow these steps to log on as a guest:

1. If you want to log on as a Guest, and Guests are allowed, click the Guest radio button.
2. Click the OK button to see the volume list.
3. If the name of the volume is not already selected, click it.
4. Click the OK button and the shared disk (server) icon appears on your desktop.

When you're finished with the shared disk, drag its icon into the Trash.

Logging on as a Registered User

Follow these steps to log on as a registered user:

1. If you are a Registered User, click the Registered User radio button.
2. Type your name and password.
3. Click the OK button to see the volume list.
4. If the name of the volume is not already selected, click it.
5. Click the OK button, and the shared disk (server) icon appears on your desktop.

When you're finished working with the shared disk, drag its icon to the Trash.

Setting Your Password

If you are a Registered User, you need to set up your Password initially and occasionally change it. Here's how:

1. Follow steps 1-6 of Connecting to a Shared Disk.
2. Click the Set Password button.
3. Click the OK button, and a dialog box appears.
4. Type your old password.
5. Press the Tab key.
6. Type your new password.
7. Click the OK button (or press Return).
8. Click the OK button (or press Return).
9. Type your new password again.
10. Click the OK button (or press Return). Your password is changed.

System 7.0 Hints and Help

To move between sections of the Chooser, press the Tab key.
To move to an item quickly within any section of the Chooser, type one or more characters that begin the name of the desired item.

Playing DTS audio files with iTunes

iTunes can play DTS (Digital Theater Systems) encoded audio files through the optical audio out port on a PowerMac G5 or an AirPort Express Base Station connected to an amplifier (or powered speaker set) with a DTS decoder.
This article has been archived and is no longer updated by Apple.
DTS decoding can only work if the digital DTS stream passes through iTunes completely unmodified. Otherwise, you will just hear static from your speakers. To make sure the sound is unmodified, follow the four steps below to make the appropriate settings.

Step 1: Drag the volume slider in iTunes to maximum.

Step 2: Set the volume adjustment of the audio file (in the Options section of the info for the file) to None.

To access this setting:

1. Click once to select a song.
2. Choose **Get Info** from the **File** menu.
3. Click the Options tab if necessary.

Step 3: Turn off these preferences:

- Sound Enhancer
- Crossfade playback
- Sound Check

To access these preferences, choose **Preferences** from the **iTunes** menu (**Edit** menu in Windows) and click the Audio button. Then deselect each of the items listed above.

Step 4: Turn off the Equalizer.

1. Click the Equalizer button.

2. Make sure the Equalizer is off.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

AppleTalk LaserWriter: Connection Setup

This article covers these topics:

- Basic preparations for networking and background printing
- Connecting to AppleTalk LaserWriters
- Selecting background printing
- System 7.x hints and help
- Where to get more information

This article has been archived and is no longer updated by Apple.

Before You Connect

To connect to AppleTalk LaserWriters, you need the following items installed in the System Folder:

LaserWriter or LaserWriter 8 (With LaserWriter 8 Print Driver you also need the PPD files from the installer disk.)

LaserWriter Prep (under System 6.0.x only)

To use background printing, PrintMonitor also must be installed in the System Folder (under System 7.x, in the Extensions folder within the System Folder). If you need to install any of these items, use your set of system disks to do so. Under System 7.x, use the copy of the Installer on the Printing disk.

Connecting to AppleTalk LaserWriters

Follow these steps to connect to AppleTalk LaserWriters:

1) From the Apple menu, select Chooser. The Chooser window appears. AppleTalk must be set to Active in the lower-right part of the Chooser window.

2) In the upper-left part of the Chooser window, click the icon of the type of printer you want (this must be an AppleTalk LaserWriter, for example LaserWriter).

3) Scroll the list of AppleTalk Zones to find the one you want.

4) Click the name of the AppleTalk Zone to select it. A list of printers and print spoolers in that zone appears in the right-hand window.

5) Click on the name of a printer or print spooler to select it. If you use LaserWriter 8, you must click the "Setup..." button and setup the printer. You may either use Auto Setup, or chose More Choices to select a specific PPD.

6) From the File menu, select Close, or click on the close box in the upper-left corner of the Chooser window.

Selecting Background Printing

With PrintMonitor, you can print on an AppleTalk LaserWriter while continuing to work with other programs (this is called background printing). Follow these steps to select background printing:

1) From the Apple menu, select Chooser. The Chooser window appears.

2) Click the LaserWriter icon in the upper-left part of the Chooser window.

3) Click the On radio button in the Background Printing section (below the list of LaserWriters).

4) From the File menu, select Close, or click on the close box in the upper-left corner of the Chooser window.

System 7.x Hints and Help

To move between sections of the Chooser, press the Tab key.

To move to an item quickly within any section of the Chooser, type one or more characters that begin the name of the desired item.

iPod (Click Wheel) shows low battery indicator during sync and iTunes "freezes"

iTunes for Mac OS X may stop responding or "freeze" if you try to sync an iPod (Click Wheel) that doesn't have enough charge. In Windows, iTunes may continue to work, but your iPod doesn't appear in the Source list.
This article has been archived and is no longer updated by Apple.
This can happen when your iPod (Click Wheel) is connected to your computer over USB 2.0. While songs or files are transferred using USB 2.0, the iPod loses charge. Transferring songs or files when iPod isn't sufficiently charged can cause incomplete transfer, loss of the information being transferred, and may require a restore. It's best to charge iPod before transferring songs or files.

To prevent this symptom, make sure your iPod is fully charged before syncing. To charge the battery, either leave it connected to the USB port without performing a sync. Or you can connect iPod to the iPod Power Adapter using the iPod Dock Connector-to-FireWire Cable. Then connect the adapter to an electrical outlet. Either way, the built-in battery is 80 percent charged in about 2 hours, and fully charged in about 4 hours.

If iTunes is not responding in Mac OS X because of this, follow these steps:

1. Force Quit iTunes.
2. Open iTunes.
3. Eject iPod.
4. Make sure iPod is charged using the power adapter or consider using FireWire to sync if the battery indicator appears low.
5. Connect iPod to your Mac and try syncing again.

In Windows:

1. Quit iTunes.
2. Eject iPod.
3. Make sure iPod is charged using the power adapter or consider using FireWire to sync if it available to you.
4. Connect iPod to your computer and try syncing again.

Creating Font/DA Backups Under System 6 and System 7

This article list the steps to create a backup font/DA file.
This article has been archived and is no longer updated by Apple.

CREATE EMPTY SUITCASE FILES WITH VERSIONS OF SYSTEM 7

If your Macintosh has a version of System 7 installed, follow these steps to create an empty suitcase:

1) Click an existing font suitcase file to select it.

2) Choose Duplicate from the File menu, or press Command-D.

3) Double-click the duplicate file to open it.

4) Drag the contents to the Trash.

5) Choose Empty Trash from the Special menu.

6) Duplicate this empty suitcase as many times as you need.

CREATE FONT BACKUPS WITH SYSTEM 7.0

This section explains two ways to create font backups under System 7.0 or 7.0.1.

Copy to Another Folder

1) Choose New Folder from the File menu.

2) Type a name for the folder (Font backup folder, for example).

3) Double-click the System Folder to open it.

4) If you want to back up your entire System file (fonts and sounds), hold down the Option key, then click and drag the System file to the folder you created. Your System file is copied (not moved) to that folder.

5) If you want to back up only some of the fonts, double-click the System file to open it. A window appears, displaying individual fonts installed in the System.

6) Select the fonts you want to copy by using either the selection rectangle or Shift-clicking.

7) Hold down the Option key and drag the font files to the folder you created. The fonts are copied (not moved) to that folder.

Copy to a Suitcase

1) Double-click the System Folder to open it.

2) Double-click the System file. A window appears, displaying individual fonts installed in the System.

3) Select the fonts you want to copy to the backup file, by either the selection rectangle or Shift-clicking.

4) Hold down the Option key and drag the fonts to one of the empty suitcases you created. Your fonts are copied (not moved) to the suitcase file.

CREATE DA BACKUPS UNDER SYSTEM 7

Copy to a Folder

1) Choose New Folder from the File menu (or press Command-N).

2) Type a name for the folder (DA backup folder, for example).

3) Double-click the System Folder to open it.

4) To back up your entire Apple Menu Items folder, hold down the Option key, then click and drag the Apple Menu Items folder to the folder you created. Your Apple Menu Items folder is copied (not moved) to that folder.

5) To back up only some of the DAs, double-click the Apple Menu Items folder to open it. A window appears, displaying individual DAs installed.

6) Select the DAs you want to copy by either the selection rectangle or Shift-clicking.

7) Hold down the Option key and drag the DA files to the folder you created. The DAs are copied (not moved) to that folder.

CREATE FONT/DA BACKUPS WITH SYSTEM 6.0.X

1) If you don't already have Font/DA Mover 4.1 on your hard drive, copy the application to your hard drive before proceeding.

Note: If you have older versions of Font/DA Mover on your hard drive, drag them to the Trash. Using an older version can damage your System file!

2) Double-click the Font/DA Mover application. The Font/DA Mover screen appears. The left-hand scroll box shows the fonts currently installed in your System file. The title below the scroll box shows the location of the fonts.

3) Click the right-hand Open... button. A standard file selection dialog box appears.

4) Click the New button. A dialog box appears so you can name the new file.

5) Type the name of the new file. Click the Create button. You are taken back to the Font/DA Mover screen.

6) Select the fonts you want to back up by dragging over the list (or you can hold down the Shift key and click each font). The selected fonts are displayed in reverse type (white letters on a black background). Arrows appear on the Copy button to show the installation direction.

7) Click the Copy button. To create a backup file of desk accessories during the same session, click the Desk Accessory radio button. The left-hand scroll box then shows the DAs currently installed in your System file. Follow steps 3-7, substituting DA(s) wherever you see font(s).

8) When you're finished, click the Quit button to go back to the Desktop (Finder).

6.0.x Hints and Help
Hold down the Option key before launching Font/DA Mover 4.1 to display DAs first rather than fonts.

Where to find the iPod Updater 2004-07-15 in Windows

The "Using iPod Updater 2004-07-15" document on the iPod (Click Wheel) CD says to "Open Setup.exe on the iPod CD" to install and use the iPod Updater.
This article has been archived and is no longer updated by Apple.
If you haven't opened the Setup.exe installer and installed the updater, go ahead and do that. If you've already done it, you don't need to do it again.

To open the updater after it's been installed:

1. Click the **Start** button, then point to **All Programs.**
2. Point to **iPod** and click **iPod Updater 2004-07-15**.

You can also find the update in this path:

```
C:\\Program Files\\iPod\\iPod Update 2004-07-15\\
```

Published Date: Feb 18, 2012

iTunes opens iPod Updater 2004-04-28 instead of iPod Updater 2004-07-15

When you connect an iPod that does not have the latest iPod software installed, iTunes 4.6 offers to open the updater for you.
This article has been archived and is no longer updated by Apple.
If both iPod Updater 2004-04-28 and iPod Updater 2004-07-15 are in your Utilities folder, iTunes 4.6 opens iPod Updater 2004-04-28.

You can use this updater if you want. The two are essentially the same. iPod Updater 2004-07-15 only includes support for the iPod (Click Wheel). Earlier iPod models, including iPod mini, can use either updater.

Quick Reference: Font/DA Mover for System 6.0.x

Font/DA Mover is a utility that installs fonts and desk accessories (DAs) in your System file. Once installed, you can use these fonts and desk accessories with any application. This quick reference covers:

- Installing Font/DA Mover

- Using Font/DA Mover

- Hints and help

- Where to get more information

Important: Make sure you use Font/DA Mover 4.1. If you have older versions of Font/DA Mover on your hard drive, drag them to the Trash. Using an older version can damage your System file.

Note: You don't need Font/DA Mover at all if your Macintosh is running System 7.0 or later.

This article has been archived and is no longer updated by Apple.

Installing Font/DA Mover

To install Font/DA Mover, copy the Font/DA Mover 4.1 application to your hard drive. You may want to keep it in the folder where you keep your other utility programs. (You don't need to keep it in your System Folder.)

Using Font/DA Mover

The steps below show you how to install fonts. The same steps apply to installing DAs. Follow these steps:

1) Double-click the Font/DA Mover application.

Once Font/DA Mover is launched, you'll see two boxes. The left one shows the fonts currently installed in your System file.

2) Click the Open... button on the right side to go to the fonts you want to install. A standard file selection dialog box appears.

3) Find the font file with the fonts you want to install, select it, and click the Open button (or press Return). You'll be taken back to the Font/DA Mover dialog box. Its window shows the contents of the font file selected for installation.

4) Select the fonts you want to install by dragging over the list on the right (or you can Shift click each font size). When you've selected the fonts, their names appear in white letters on a black background. The Copy button highlights automatically. Arrows on the button show the direction in which you're installing.

5) Click the Copy button to install the fonts. If you're in MultiFinder, you'll get a message saying that the fonts and DAs installed.

6) Click the OK button.

7) When you're finished, click the Quit button to return to the desktop (Finder). If you're in MultiFinder, restart your Macintosh.

To install desk accessories during the same session, click the Desk

Accessory radio button. The left scroll box then shows the DAs currently installed in your System file. Follow steps 3-6, substituting the word "DA(s)" wherever you see "font(s)" in the instructions.

Hints and Help

To display DAs first, rather than Fonts, hold down the Option key while launching Font/DA Mover.

Where to Get More Information

Your iPod has a sticky residue on it after removing the protective shipping materials

After removing the clear, protective shipping material from your iPod mini or iPod (Click Wheel), there may be some sticky residue left on the click wheel.
This article has been archived and is no longer updated by Apple.
Follow these steps to remove the residue:

1. Slide the iPod's Hold switch to the "Hold" position.
2. Take a piece of clear adhesive tape and stick it on the click wheel. Carefully pull the tape off making sure to remove some of the residue with it. Repeat this process until the majority of the residue is gone. Standard household tape will work fine.

3. Put a few drops of isopropyl alcohol on a soft, lint-free cloth.
    - Do not put the cleaning solution directly on the iPod.
    - Do not use paint thinner of any kind.
    - Do not use nail polish remover of any kind.
    - Do not use denatured alcohol.
    - Do not use any ammonia-based cleaner, such as glass cleaner.
4. To prevent excess alcohol from getting inside the iPod while cleaning it, hold your iPod upside down so that the click wheel is facing the floor.

5. Gently rub the iPod's affected areas (from the center to the edges) to remove any sticky residue. Avoid excessive contact with the screen area. Repeat as necessary.
6. Use a soft, dry, lint-free cloth to remove any finger prints or smudges.
7. When you've finished cleaning, slide the iPod's Hold switch out of the locked position.

If your iPod doesn't respond or seems unresponsive when you wake it from sleep and turn off the Hold switch, wait about 30 seconds, then see if your iPod recovers and works normally.

If iPod does not start working normally after about 30 seconds, take these steps:

1. Slide the Hold switch to the locked position (toward the headphones port).
2. Slide the Hold switch to the unlocked position (away from the headphones port).

Why is the iPod and iPod mini CD called iPod 3.0.1 CD?

The name that appears below the icon for the iPod and iPod mini CD reflects the version of the CD, not the version of the iPod Software on it.
This article has been archived and is no longer updated by Apple.
It appears this way in the Mac Finder:

And this way in the Windows Explorer:

3.0.1 is the version of the iPod and iPod mini CD, not the version of the iPod Software that it contains.

The iPod and iPod mini CD that has the name "iPod 3.0.1 CD" contains:

- iPod mini 1.1
- iPod Software 3.0
- iPod Software 2.2
- iPod Software 1.4

To verify which software a certain version of iPod Updater application installs, see "About the universal iPod Updater."
Published Date: Feb 18, 2012

AppleShare Print Server: Error -120 Is "directory not found"

I am having problems with an AppleShare Print Server IINTX. When any of the workstations try to print to the network LaserWriter, the print server instantly aborts the print job. After this, the printer must be reset to be re-captured.

A message comes up on the screen stating that the computer is trying to clear the print buffer. I also get a message stating that error number -120 has occurred.

This article has been archived and is no longer updated by Apple.
The -120 error is a "directory not found" error that could relate to a hardware failure on the server. ?If you can print to the LaserWriter IINTX via the bypass feature of the AppleShare Print Server, then there is a problem at the server level. It is most important to determine that the workstations can print to the LaserWriter IINTX on bypass to verify the integrity of the hardware.

Here are two things to try on the server:

1) If you reinstalled the software over the old files, trash the old files first, then re-install.

2) Consider backing up the server in a file-by-file manner, re-initializing the drive, and restoring the files. The print server may be running into some bad sectors which inhibit its ability to spool the files.

Published Date: Feb 18, 2012

System 7: Application Cannot be Found Error/Fix

I have been using System 6 on my Macintosh and putting my applications on the Desktop (as opposed to within any folder). After installing System 7, I rebuilt the Desktop and "lost" these applications. However, they appeared again in their correct place, when I opened the hard disk icon.

The issue is that when I try to open a document created by any one of these applications, I get an error message that says, "The application cannot be found."

This article has been archived and is no longer updated by Apple.

The fix is to move the application to the hard disk window. Then, if you want, move it back to the Desktop. This seems to "force" the Finder to update the Desktop correctly.

Song titles scroll differently after updating an iPod (click wheel)

Song titles that are too long to fit on the iPod screen scroll across the screen so you can read the whole title.
This article has been archived and is no longer updated by Apple.
iPod Updater 2004-08-06 enhances the power-conserving features of the iPod (click wheel) by changing the way long song titles scroll.

If you have trouble reading the scrolling text, from the main menu, select Settings > Contrast and try lowering the contrast.

LaserWriter IIf & IIg: PhotoGrade, RAM, and Image Size (3/95)

When we print to the LaserWriter IIg, there is a half-inch margin around the outside of each page. We've been printing closer to the edge of the page with the LaserWriter IINT and IINTX. How can we adjust this on the LaserWriter IIg?

This article has been archived and is no longer updated by Apple.
These margin differences are caused by the memory requirements of PhotoGrade. The LaserWriter IIg defaults to using PhotoGrade enhancement unless told otherwise. Because a letter-size image -- with PhotoGrade enabled -- needs a frame buffer four times larger than an unenhanced image, the LaserWriter reduces the image size as required. It reduces a letter-size buffer, which would use 3935376 bytes, to a lettersmall buffer that uses 3511296 bytes. This can lead to the cropping of images when printing with non-Apple drivers (as on a Sun workstation), since the printer will crop any part of the image that falls within the larger margins.

As shipped, the LaserWriter IIg has only enough memory for an a4small frame buffer with PhotoGrade enhancement. Without PhotoGrade enabled, it can easily handle a full legal-sized image, but must be explicitly instructed to do so. You can do this in a couple of ways:

- Disable Photograde
If the PostScript operator for the required page size is included in the print job, the LaserWriter will disable PhotoGrade to maintain compatibility.

- Modify the Default Parameter
You can modify the persistent parameter that forces the PhotoGrade default. This is probably not a good idea unless you find it easier than modifying the printing code. It is inconvenient, and modifies the persistent memory. You can modify the persistent memory a limited number of times before it wears out.

To request a specific page size and override PhotoGrade, include a reference to the required page size in the beginning of the print job. The different page size operators are listed below, along with their memory requirements with and without PhotoGrade enhancement.

.	PhotoGrade	
Page Size	Off	On
b5	741888	2967552
lettersmall	877824	3511296
a4small	924420	3697680
letter	983844	3935376
a4	1015872	4063488
legal	1257344	5029376

If you print a job with no requested page size, the LaserWriter IIf and IIg use the default size of lettersmall. If the job specifies a size, the LaserWriter will try to honor it as closely as possible within its memory limitations. The following table depicts the page size substitution order.

Frame Buffer Substitution Order
lettergray -> lettersmallgray -> letter -> lettersmall
legalgray -> legal -> lettersmall
a4gray -> a4smallgray -> a4 -> a4small
b5gray -> b5

With the Apple LaserWriter IIf as shipped with 2MB, a request for a letter-size frame buffer results in a lettersmall buffer, the default. Requesting an a4 page results in an a4small buffer. The next table shows the maximum page size available for each memory configuration.

MB	Largest Page Size
2	a4small, PhotoGrade disabled
4	legal, PhotoGrade disabled
5	a4small, PhotoGrade enabled
8	legal, PhotoGrade enabled

In summary, prepending the letter operator to the documents would be adequate. Or you can disable PhotoGrade one time, and leave it alone until you need it again later. Note that the non-volatile RAM used in both the LaserWriter IIf and IIg has a limit to the number of times it can be modified: approximately 50000 writes. While this is a large number, you could rapidly exceed it if the modification were sent with each page or job. Once this part wears out, the factory defaults will be used each time the LaserWriter is powered on.

The following three code segments show, respectively:

- The letter operator at the start of a job
- Code to disable PhotoGrade
- Code to enable PhotoGrade

Caution:

If you choose to use the PostScript code provided in this article, you assume all risks involved in making these changes. PostScript code, if not entered correctly, can place the LaserWriter into a condition requiring service.

LaserWriter IIf and IIg: Changing Passwords

How do I change passwords on the LaserWriter IIf and IIg?

This article has been archived and is no longer updated by Apple.
Because the LaserWriter IIf and IIg use implementations of Level 2 PostScript, setting their passwords is a bit different from previous models. This is primarily because Level 2 uses two different passwords -- one to secure system parameters, and another to secure use of the startjob operator. You will probably want to change both. This will achieve similar functionality to the Level 1 setpassword operator. Here is sample code to change both passwords:

```
<</Password (0) /StartJobPassword (2)>> setsystemparams
<</Password (0) /SystemParamsPassword (2)>> setsystemparams
```

In both cases, the string following the /Password name must equal the current SystemParamsPassword. This password is required in order to change either the StartJobPassword or the SystemParamsPassword. Once these two have been redefined, the level of security is identical to that available through the setpassword operator in a Level 1 implementation. The two passwords need not be equal, and can be strings of up to 32 non-null characters. You can use an integer instead (as with Level 1), but internally it will be converted to a string containing the ASCII representations of each digit. Here is a version of the above code that changes both passwords, each to a different integer.

```
<< %Push a mark on the stack.
/Password 0 %Push key/value pairs for current password,
/StartJobPassword 2 %the new StartJobPassword, and the new
/SystemParamsPassword 4 %SystemParamsPassword on the stack.
>> %Create dictionary of the kv pairs up to mark.
setsystemparams %Use the dictionary to set system params.
```

Once this is sent, the value 4 or string (4) will be required as a password to change settings.

Level 2 introduces many new concepts to the PostScript world, and a complete STARTDISCUSSsubject. The current reference is available from Addison Wesley as the PostScript Language Reference Manual, 2nd Edition, by Adobe Systems Incorporated.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

Macintosh Quadra 700, 900 & 950: SCSI Termination

This article addresses SCSI termination issues with the Macintosh Quadra 700, 900 and 950 computers.
This article has been archived and is no longer updated by Apple.

What is SCSI?

SCSI (Small Computer System Interface) is a standard by which one connects a device to the CPU. This device can be an external hard drive, CD ROM, Printer, Scanner, etc. The SCSI bus needs to be terminated at both ends to eliminate signal reflections.

How is the Quadra 700 Terminated?

There are termination resistors on the internal drive. This would terminate the internal end of the bus.

If the internal hard drive is removed, an internal SCSI terminator must be installed (Apple Part Number 630-0408). This part was originally designed for the Macintosh Classic computer, and a service provider can locate this part listing in the Macintosh Classic section of the Service Source CD; Technical Procedures or Macintosh Service Guide book. Apple US Service Administration can help a service provider order this part by overriding the standard minimum order.

Floppy only system

Apple will install a plug-in terminator (Apple Part Number 630-0408) into the internal SCSI connector on the main logic board; thereby terminating one end of the bus as an internal drive would do. As external devices are added the last device should have an external terminator installed (Gray Terminator, Apple Part Number 658-8032). This way the bus is terminated at both ends.

How is the Quadra 900 and Quadra 950 Terminated?

The Quadra 900/950 has two SCSI buses, Internal and External.

The Internal Bus is terminated on both ends (one termination on the logic board and the other at the other end of the internal SCSI cable). This means that any internal device should not have termination resistors. Therefore, confirm the termination resistors have been removed before installing a device inside the Quadra 900/950!

Note: All prior Macintosh computer required the internal hard disk drives to have termination resisters on them. Hence, most hard disk drives' vendors ship their internal disk drives with termination resistors installed. With the Quadra 900/950, the terminators need to be removed since the internal bus is already terminated at both ends.

External SCSI is terminated on the logic board. As external devices are added, the last device should have an external terminator installed (Gray Terminator- Apple Part Number 658-8032).

Though the Quadra 900/950 has two independent SCSI buses, system software views the two as a single logical bus. Like with other Macs, the CPU ID is 7. This allows a total of 7 SCSI devices (IDs 0-6) to be added internally and externally. Users must be careful not to use the same ID on more than one device (internal or external).

Applesoft: Auto RUN byte and protecting programs

This article has been archived and is no longer updated by Apple.
A byte in memory causes any Applesoft command entered from command mode to be interpreted as a RUN command.

POKE 82,213
SAVE

causes this automatic RUN byte to be set when the program is loaded from tape. This "protection" scheme is very easy to defeat, and is not widely used. It does not protect the program from DOS commands.

POKE 214,128
sets the auto-run byte from command mode or from within a program. Take care with this POKE because there is no way to reverse it from command mode because the next POKE will RUN the program.

POKE 214,0
from within a program will return the auto-run byte to normal.

VideoSync: Avoiding Flicker when Video Taping a Macintosh (3/95)

This article desbribes VideoSync, a product which eliminates flicker when video taping the image on a Macintosh monitor.

This article has been archived and is no longer updated by Apple.
VideoSync is a utility designed to allow the video recording of Macintosh monitor images with consumer or professional video camera equipment. VideoSync supports the Macintosh Display Card 4*8, 8*24, 8*24 GC, Apple High Resolution Video Card, and the Macintosh II Video Cards when connected to an AppleColor High Resolution RGB or monochrome monitor or Macintosh 12-inch RGB Display.

The utility is an extension to the Monitors control panel that adjusts the timing of the Apple display card so that the monitor image appears stable when viewed by an external NTSC camera. VideoSync does not create RS-170A timing for directly recording Macintosh screens to VCR. VideoSync can be licensed as a stand-alone utility for video integration applications, or serve as a platform on which to add other video timing alternatives.

The VideoSync utility is not compatible with Power Macintosh and Quadra AV computers. See the Tech Info Library article titled "VideoSync: Not Supported on Power Macintosh" for additional information on compatibilty with the Power Macintosh and Quadra AV computers.

VideoSync is available through online services Apple publishes software updates on.

These articles can help you locate software updates mentioned here:

- Where To Find Apple Software Updates
Lists online services for "free" Apple software updates

- Obtaining Apple Product Support in the USA
Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library

Article Change History:
28 Mar 1995 - Changed filming to video taping in title.
03 Mar 1995 - Added where to locate VideoSync.

Macintosh 16-Inch Color Display: Features and Benefits

This article describes the features and benefits of the Macintosh 16-inch Color Display.

This article has been archived and is no longer updated by Apple.

The Macintosh 16-inch Color Display works with modular Macintosh systems such as the Macintosh Quadra 700 and 900 personal computers. You can organize your work more effectively using the Macintosh 16-inch Color Display, because its 16-inch diagonal screen gives you 70 percent more work area than standard monitors. Not only can you see multiple windows of text and color graphics at the same time, you can also access disk volumes and the Trash while a full page-width document is open.

The Macintosh 16-inch Color Display uses a Sony Trinitron picture tube with a high-contrast screen. This combination ensures sharp focus, high brightness, and uniform image clarity across the entire screen. A tilt-and-swivel base adjusts easily to a comfortable viewing angle, and an anti-glare, anti-static screen reduces glare and eliminates dust build-up.

The display's brightness, contrast, and power controls are located on the front panel, and several built-in ports allow easy connection to Apple Desktop Bus devices (such as keyboard or mouse), microphone, and headphones.

Display Quality

- 16-inch screen, 832 horizontal by 624 vertical pixels (at 70 dots per inch) for 70% more work area than standard monitors

- Trinitron color picture tube for high brightness, sharp focus, and uniform color

- Complements high-performance systems such as the Macintosh Quadra 700 and Quadra 900

Ergonomic Features

- Tilt-and-swivel base for adjustment to comfortable viewing angle

- Anti-glare, anti-static screen

- 75 hertz refresh rate and degaussing capability eliminate flicker and distortion

- Meets Swedish MPR recommendations for low-frequency magnetic emissions

Ease of Use

- Plug-and-play simplicity with most modular Macintosh computers

- Easy access to brightness, contrast, and power controls

- Built-in ports for ADB devices (such as keyboard or mouse), microphone, headphones, or external speakers

Power Controls

Built-in ports for ADB devices (such as keyboard or mouse), microphone, headphones, or external speakers

System Requirements

- a modular Macintosh computer with on-board video support, such as a Macintosh Quadra personal computer, or
- any NuBus-capable modular Macintosh such as the Macintosh IIsi or IIci.

Macintosh: Troubleshooting System Bombs (1 of 3)

Most system bomb error messages are due to software problems. This article provides troubleshooting tips for four major types of software.

This article has been archived and is no longer updated by Apple.

THE FOUR MAJOR TYPES OF SOFTWARE

System Software

System software includes all the files in the System Folder that make up the Operating System.

- The files named System and Finder are the main components of the operating system and are loaded into RAM when you turn on or reset the computer.

- INITs (Extensions) are startup programs and initialization resources stored in the System Folder (with System 7, they are inside the Extensions folder). They are memory resident files that are loaded into RAM when you turn on or reset the computer. Examples: QuickMail and Easy Access.

- cdevs are control panel devices. These files appear as scrollable icons in the Control Panel desk accessory window under System 6, or as separate, launchable programs in a Control Panels folder under System 7. They are loaded into RAM when you turn on or reset the computer. You may change options from within each Control Panel. Examples: Pyro, After Dark, Adobe Type Manager, and Sound Master.

- RDEVs are remote devices or Chooser files. These files appear in the Chooser under the Apple menu. Examples: ImageWriter, LaserWriter, DeskWriter, CD-ROM, and AppleShare. Under System 7, they belong in the Extensions folder.

- Preferences files keep default or current settings for programs. Examples: Word Settings, MsWorksPref, PM4 Defaults, and Excel Settings.

- Some files are combinations of the above. Examples: Pyro (INIT/CDEV) and StyleWriter (INIT/RDEV).

NOTE: To simplify the description of INITs, cdevs and RDEVs, this document will use the collective term INIT to describe any file that contains INIT code to be executed at startup time.

Application Programs

Examples of application programs: Microsoft Word, Microsoft Excel, Microsoft Works, FileMaker Pro, MacPaint, MacWrite, and Aldus PageMaker.

Program Files

Program files are the files that contain data or instructions a program may need during its use. Examples: printer definition files, import/export filter files, and data files.

Data Files

Your files are the documents created when you choose "Save" in a program. Examples: word processing, spreadsheet, communication, database, drawing, and page layout files you created.

TROUBLESHOOTING SYSTEM BOMBS

Here are some troubleshooting tips for the various types of software.

System File & System Folder Procedures

- Put a Disk Tools or System Startup diskette in the floppy drive and turn on your computer. This prevents the INITs in the System Folder from running, and eliminates them as a possible cause of the problem. This is a quick way to determine if a major problem which occurs near startup time is related to your System Folder. If the problem is resolved, then continue on with the next step. If the computer still bombs right away and you know your System Disk is good, then you may have a hardware problem.

- Move all INITs and non-Apple files* (Preferences files, screen fonts, and so on) to a separate folder outside the System Folder and restart. If you're no longer getting system bombs, replace the INITs one at a time, and restart your computer following each replacement until you get the error again. The last one put in is likely the cause of the crashes. It may be corrupted or incompatible with the System or other INITs and/or programs. If you still get a system bomb after removing all INITs and non-Apple files from the System Folder, try the next step.

* Non-Apple files are any files that AREN'T found on the original Apple Macintosh System Disks that come with your computer.

- Start up from your Disk Tools or System Startup disk. Open the System Folder and drag your current System and Finder files to the trash. (For System 6, consult your user's manual on the use of the Font/DA Mover program to copy your fonts and desk accessories out of the System file first.) Reinstall a new copy of the system using the Installer on your System Tools or Install 1 disk. If this doesn't work, try the next step.

- The Preference files may be corrupted. You can drag some to the trash and the programs will recreate the files the next time you run those programs (settings saved in these files will be lost). You will have to copy some Preference files using the program installation procedure. Consult your program manual or call the manufacturer of the program to find out what is necessary. If the system doesn't work once the new Preference files have been created, try the next step.

- Start up from your Disk Tools or System Startup disk. Drag the entire System Folder to the trash (be sure you have all INITs, preference files, fonts, desk accessories, and any other non-Apple files on floppy disks or in another folder on the hard drive before this procedure. For System 6, consult the manual on the use of the Font/DA Mover program to copy your fonts and desk accessories out of the System file.) Restart from the installation disk (Install 1 under System 7) and run the Installer to place a new copy of the System Folder on your drive. Check the system before re- installing your INITs, preference files, fonts, desk accessories and any other non-Apple files. If it works, re-install them one at a time until the System Folder is back to its original state. If this does not work, continue.

Programs, Program Files, Data Files

Programs or files may be the cause of problems. Here are some suggestions.

- You may (if possible) run the program from a floppy disk instead of the hard drive to determine if it is the cause of the problem. This is likely if you get the bomb in one program and no others. If this is not possible then try dragging the program's folder to the trash (saving any files you may have created first). Also throw away any preference files or folders associated with the program in the System Folder. Re-install the program from the original diskettes. If this does not work, try the next step.

- A file that you have created may cause a bomb each time it is loaded or while you are using or editing it. Sometimes you can make a new file and copy the contents of the old file to it to solve the problem. In most cases you will need to restore the file from your backup if you have one or re-create the file if you don't.

Macintosh: Troubleshooting System Bombs (2 of 3)

This article lists some of the common causes of system bombs.

This article has been archived and is no longer updated by Apple.

Incompatible Software

Many pieces of software (System, INITs, Applications) are loaded into memory and run at the same time. System bombs occur if the versions of the software aren't compatible. You may call the application's manufacturer to find out if the software is compatible with your system and the other software you are running. You can find versions of programs, INITs, and the System file by selecting the file's icon at the Finder and choosing Get Info from the File menu.

Corrupt Software

Sometimes a piece of software may become corrupted. Events that can corrupt files include:

- Not choosing Shut Down before turning off your Macintosh.

- SCSI data line problems can corrupt software or even the format of your hard disk.

Viruses

A virus is seldom destructive, but can do any of the following:
- Display messages.
- Corrupt software.
- Change software or hardware settings.
- Cause system bombs.

The Tech Info Library contains several articles about viruses and their symptoms.

Hardware Problems

In a few cases, certain hardware problems may cause system bombs. Using peripherals or expansion cards that aren't fully compatible with the computer can cause bombs. Bad or insufficient memory may also cause bombs.

Published Date: Feb 18, 2012

Macintosh: Troubleshooting System Bombs (3 of 3)

Here are some troubleshooting tips regarding the major causes of system bombs.

This article has been archived and is no longer updated by Apple.

Incompatibility in Software

Verify that your application is the most current version available and fully compatible with your Macintosh model. Check with the software manufacturers for information on the latest revisions, what version of the system should be used with what version of the application, and incompatibilities.

All INITs, programs, and System files must be compatible with each other. You need to know the EXACT version of applications and INITs. For example, Microsoft uses version numbers in the following sequences: 2.0; 2.00a; 2.00b; 2.00c; 2.00d. These represent Microsoft Works versions. Microsoft Works 2.00a is a problem in the System 6.0.7 environment. Microsoft Works 2.00b is compatible with System 6.0.7. It isn't enough to state that Microsoft Works 2.0 is a problem. The version numbers need to be EXACT.

Corrupt Files

Any type of software may become corrupted. It can be very difficult to find out which piece of software may be causing your problem. Following the steps outlined in the "Troubleshooting System Bombs" section may be the only way to discover the corrupted software.

Viruses

The best way to combat viruses is with one of the many virus detection and correction programs available today. Viruses haven't caused problems on computers with the latest copy of a virus protection program installed. You'll need to start your computer from a floppy disk containing a virus detection program to fully check and "vaccinate" your hard disk. The System file and other software may not be diagnosed or fixed if they are running when the hard drive is checked. Once the hard drive has been checked and cleared of any offending viruses, an INIT file that scans each floppy disk as it is inserted will keep your system virus free. See the discussion of "Co-processor not installed!" errors for some information on the WDEF virus.

Hardware

If hardware is the problem, you should take your system to an authorized Apple dealer for a thorough diagnostic check. If problems continue after you've explored all software situations, look at hardware -- particularly memory or memory management.

It could be RAM or the logic board. RAM problems can show up after warm-up. For example, a marginal SIMM's speed may be fine when cool but slow down after warming up. All SIMMs do this to a certain extent, but you may have a SIMM that crosses the Macintosh computer's tolerance threshold when warm. The only fix for this is to replace the offending SIMM or SIMMs. A similar problem could be happening within the memory manager's circuitry on the logic board; the only possible fix is a complete logic board replacement.

You may also have a SCSI problem, particularly if you have external SCSI devices attached. This problem occurs most often when you have external SCSI devices attached, but not turned on. You must turn on all SCSI devices before starting the Macintosh, and you must leave them on until you

turn the Macintosh off. If you don't take these precautions, you can introduce garbage onto the SCSI data line.

Improper termination of the SCSI chain also causes this problem. If your SCSI chain is the source of your problem, be aware that the garbage on the SCSI chain may have corrupted the hard drive's format. You'll need to reformat your hard drive with either all the external SCSI devices removed or all of them turned on.

Radius Multimedia Products: Support for Apple QuickTime

Radius, Inc. is upgrading RadiusTV and ImpressIt to take advantage of the new features in QuickTime. QuickTime provides a standard architecture and interface for multimedia hardware and software applications on the Macintosh. QuickTime compatibility allows integration of Radius multimedia products with QuickTime-compatible hardware and software products from other vendors, increasing the range of multimedia options available.

This article has been archived and is no longer updated by Apple.
Radius has rewritten the software for RadiusTV and ImpressIt to take advantage of QuickTime features, including:

- A time-management control system for synchronizing data
- Interface guidelines for hardware products
- Drivers for multimedia peripherals such as CD-ROM drives
- Built-in video editing

By supporting QuickTime, RadiusTV will be compatible with all other QuickTime compatible multimedia software applications. Previously, software applications required a special driver for compatibility with RadiusTV. Now, an application software developer can write a single QuickTime-compatible driver for a program to obtain compatibility with all QuickTime compatible multimedia hardware products like RadiusTV.

ImpressIt, Radius' still-image compression software, has been designed to integrate seamlessly with QuickTime. Users may elect to have ImpressIt automatically compress images when saved to a hard disk, rendering the entire compression process transparent.

RadiusTV

RadiusTV is a multimedia hardware and software platform that blends an array of audio and visual sources on the computer. RadiusTV features a video processing engine and an external audio-video input processor and television tuner -- to bring television functionality into the Macintosh environment.

RadiusTV is capable of displaying and digitizing live 16-bit video images in real-time (30 frames/sec) in a resizable window of up to 640 x 480 pixels. RadiusTV also digitizes sound in real time and provides access to information included in the television signal's vertical retrace interval (such as closed captions and calibration settings), making complete Macintosh control and processing possible. RadiusTV also includes Theatrics, a software package that allows image processing on captured images.

ImpressIt

ImpressIt is a Macintosh software compression product for color and grayscale still images. The fastest software solution available today, ImpressIt can compress images by up to 100 times. ImpressIt is based on the JPEG (Joint Photographic Experts Group) standard. A 24-bit 750K color image can be compressed to 25K in under 3 seconds when run on a Macintosh IIfx.

QuickTime: How Movies Work

The most important thing about QuickTime is that it allows users to create, play, and edit sets of time-based data. If you want to capture new video footage, you will need extra equipment -- a digitizer card, video camera or controllable VCR, and associated components. But you will be able to play and edit movies and other time-based data without extra hardware.

This article describes the movie feature of QuickTime, and provides some human-interface suggestions.
This article has been archived and is no longer updated by Apple.

Movies, Tracks, and Media

A movie file contains a resource of type 'moov' (pronounce it "moo-vee"), which describes the movie in terms of its tracks, its media, and its references to the raw data the movie is to play.

Assume the movie contains all the knowledge needed to run the movie (the tracks and the media), but not the actual contents of the movie (the data). The data can easily run into multiple megabytes, whereas the movie itself is short enough to fit on the 2 Clipboard. By factoring out the large amount of data needed to play a movie, Apple engineers have made the movie file small enough to be moved, edited, cut, copied, or pasted easily.

You can think of a QuickTime movie as a container for tracks. The movie starts at time 0 and plays until it is finished. Depending on how they are defined, one or more tracks (each containing one kind of data: video, animation, or sound, for example) are active and playing at any instant.

To keep the concept of a QuickTime media general enough to be useful with vastly different data types, a media contains not the data but a one-to-one, linear mapping between itself and the data. (Yes, we do call it "a media," largely because QuickTime documentation, routine names, and variables exclusively use the word media instead of medium.) The data, for now, is always in a file somewhere on the network. Someday the data may be outside the Macintosh and its network -- for example, on a videotape in a VCR the Macintosh controls.

Each track has exactly one media associated with it, and vice versa. The track, through the media and code called the media handler, points to whatever data should be playing at any given time. This means that a track can omit part of the media, play segments out of sequence, play the same segment multiple times, or even play sequences that overlap within the media. This means that a movie-editing program can rearrange or delete movie footage simply by adding or changing a handful of pointers within a track. (If such a program had to cut and paste the actual footage, the program would be prohibitively slow and the delay would be proportional to the amount of footage moved.)

Movies, tracks, and media all have time scales; and they can all be the same, or they can be different. If the time scale of a track is 10, then ten such units make one second of playing time, and the track can start at any 1/10-second interval. Fortunately, QuickTime takes care of synchronizing all these time scales with the others.

Human Interface Suggestions

For QuickTime to be successful, movies must have certain basic behavior that users can learn (or, better, already know) and then forget. A program should be able to select a movie, cut or copy it to the Clipboard, and paste it from the Clipboard into a document.

A program should also implement an easy, common-sense way of playing and stopping movies and controlling the sound output (a sound-mute control is mandatory, but a volume control is even better). Apple created a new Macintosh human-interface element, the standard movie controller.

The standard movie controller can give basic movie control to users in the same way every other QuickTime program will. With a few Movie Toolbox routines, the standard movie controller gives users basic control of the movie's playback.

Here are some enhancements to movie behavior to implement:

- A poster is a single image that best represents the movie. It might be used when the movie is visible in its document but isn't playing or when the document containing the movie is printed. The poster can come from one of the movie's video tracks (that is, the frame at time t from track x), or it can be an arbitrary image in its own track. (Apple recommends that you store a poster as a PICT with an uncompressed pixmap so that the user can see it in the Preview dialog box even if the proper decompressor isn't present.)

- A preview is a short subsequence of the movie that also represents the movie in an appropriate context; it might play, for example, when a user is previewing a long movie file.

- Another useful option for movies is that of alternate tracks. With them, you can specify alternative representations of the same data, with the understanding that only one is active at a time. A simple example is an instructional movie that has vocal instructions in Spanish, English, and French, only one of which the user chooses when playing the movie.

Another example is a movie that contains two alternative video tracks, one (of lower quality) meant to be played by a software-only decompressor and the other (of higher quality) requiring hardware decompression. The program playing the movie could then automatically show the movie at the best quality level available to the program and its hardware.

QuickTime: Image Compression Details

Apple supports all compression schemes through QuickTime's Component Manager and Image Compression Manager services.

Here is a brief overview of compression characteristics and the initial Apple-supplied compressors.
This article has been archived and is no longer updated by Apple.

Characteristics

There are four main characteristics of image compression algorithms:

- Compression ratio
- Image quality
- Compression/ decompression speed
- Spatial/temporal compression

Compression Ratio

The compression ratio is equal to the size of the original image divided by the size of the compressed image. This ratio gives an indication of how much compression is achieved for a particular image. Most algorithms have a typical range of compression ratios that they can achieve over a variety of images. Because of this, it is usually more useful to look at an average compression ratio for a particular method.

The compression ratio typically affects the picture quality. Generally, the higher the compression ratio, the poorer the quality of the resulting image. The tradeoff between compression ratio and picture quality is an important one to consider when compressing images.

Furthermore, some compression schemes produce compression ratios that are highly dependent on the image content. For example, a highly detailed image of a crowd at a football game may produce a very small compression ratio, whereas an image of a pure blue sky may produce a very high compression ratio.

Image Quality

Compression schemes can be lossy or lossless. Lossless schemes preserve the original data. Lossy schemes don't preserve all the original data; you can't recover lost picture information after compression. Lossy schemes attempt to remove picture information the viewer won't notice. As more and more picture information is removed, the picture quality decreases.

Compression/Decompression Speed

Compression and decompression time is defined as the amount of time required to encode and decode a picture, respectively.

Compression/decompression speed depends on:

- The complexity of the compression algorithm
- The efficiency of the implementation of the algorithm
- The speed of the processor hardware

Generally, the faster that both operations can be performed, the better. Fast compression time speeds up the material creation. Fast decompression time speeds up display and user interaction with images.

Spatial and Temporal Compression

Spatial compression removes information from within a single still image. Temporal compression removes information between frames.

Apple-Supplied Compressors

Apple supplies a basic set of three image compression algorithms for the first release of QuickTime:

- The Photo Compressor
- The Animation Compressor
- The Video Compressor

It's important to note that these compressors represent only a portion of Apple's overall compression strategy, which includes both hardware and software-based schemes. Software-based video compression provides users with a starting point that meets the minimum requirements of many applications while allowing room for additional schemes.

The following paragraphs discuss each of these compressors in greater detail.

Photo Compressor

The Photo Compressor implements the Joint Photographic Experts Group (JPEG) algorithm for image compression. JPEG is an international standard for compressing still images. The technique is based on the use of the Discrete Cosine Transform (DCT). The version of JPEG supplied with QuickTime complies with the ISO baseline standard.

The general character of DCT-based compression schemes is that they perform best on images that vary smoothly, or that don't have a large percentage of their areas devoted to edges or other sharp detail. Most natural images fall into this category. For such 24 bits per pixel images, the Photo Compressor will produce a reconstructed image which is visually indistinguishable from the original at a compression ratio of 10:1. In practice, you will find that compression ratios are highly dependent on image content, but generally range from 5:1 to 100:1, with excellent picture quality resulting from compression ratios between 10:1 and 20:1. Compression time is equal (or very nearly equal) to decompression time.

On a Macintosh IIcx, it takes approximately 10 seconds to decompress images at 640 x 480 pixel resolution. The compression speed scales with CPU performance, so on a Macintosh IIfx, the same operation would require approximately 4 seconds. Photo quality is generally very good to exceptional and is often sufficient for use in demanding desktop publishing applications. Very high resolution images obtained through the use of 24-bit color scanners would best be compressed using the Photo Compressor.

Animation Compressor

Apple developed the Animation Compressor algorithm, based on run-length encoding techniques. This algorithm is best suited to animation and computer generated content. In addition, the Animation Compressor can compress sequences of screen-recorded images, such as those created by Farallon's ScreenRecorder product.

Like any QuickTime compressor, the Animation Compressor can compress input video images from all bit depths (1, 2, 4, 8, 16 and 24-bit color depths), and can decompress to all bit depths.

The Animation Compressor compression method can be considered an extension of the PICT image format to the temporal domain. A PICT image is stored in run-length encoded format and is lossless. Animation Compressor is also stored in run-length encoded format. However, Animation Compressor can work a lossy or lossless mode, and can support both spatial and temporal compression. Both modes maintain picture content precisely, storing an animation as a series of run-length encoded images. The lossy mode loses some quality, storing the difference between certain frames rather than the frames themselves, but is fast enough for real-time playback.

The Animation Compressor can play back images at up to 30 frames per second at full-screen resolutions, but its performance and achieved compression ratios are highly dependent on the type of images in a scene.

Video Compressor

Apple developed the Video Compressor image compression to permit fast decompression while maintaining good picture quality. This rapid decompression also displays 24-bit still images very quickly.

The Video Compressor should generally be used for digitized video content rather than for synthetically generated images. This compressor supports both spatial and temporal compression. If you use only spatial compression, then you will obtain compression ratios from 5:1 to 8:1 with reasonably good quality. If you use both spatial and temporal compression,
the compression ratio range extends from between 5:1 to 25:1.

On a Macintosh IIcx, it takes half a second to decompress an image at full-screen resolution, and about three seconds to compress the same image. The compression speed scales with CPU performance, so on a Macintosh IIfx compressing a full-screen image requires one second, and decompress time is 1/5 second.

SNAps 1.1: Host Prnting to 3287 Devices & Apple Printers

Will the 1.1 version of SNA*ps include support for host printing on LAN based printers?

This article has been archived and is no longer updated by Apple.

The SNA*ps version 1.1 release will support host based printing to 3287 type devices using Apple's network printers. It will support LU type 1 and LU type 3 devices. SNA*ps 1.1 is REQUIRED for the Apple 4/16 Token Ring card AND all Quadra computers!

Published Date: Feb 18, 2012

Apple Token Ring 4/16 NB Card: Compared to TokenTalk Card

1) What are the differences between the Token Ring card and the earlier TokenTalk card?

2) Is an upgrade available?

3) Why did Apple change the name from TokenTalk Card to Token Ring Card?

4) What kind of speed increases can I expect at 16Mbps?

This article has been archived and is no longer updated by Apple.
1) There are three main differences between Apple's previous Token Ring card and this one:

- Transmission speed
The old card supported only 4 Mbps transmission, and the new card supports both 4 and 16 Mbps.

- On-board memory capacity
The old card came with 512K RAM on the card, but there was no expansion capability. The new card comes with 512K standard, expandable to 1 or 2.5MB.

- Token Ring technology
The old card used the Texas Instruments TMS380 Token Ring chip set. The new card uses the industry-standard IBM Token-Ring chip set.

2) There's no upgrade program at this time.

3) Both of the cards are based on IEEE 802.5 standards for Token Ring, and will therefore work in all standard Token Ring environments. You can use multiple protocol stacks with the cards, including SNA and AppleTalk. In fact, because both cards are based on the Macintosh Coprocessor Platform architecture, you can run multiple network protocols simultaneously. Still, some customers found the name TokenTalk confusing, thinking that the card only supported AppleTalk protocols. We have changed the name to reflect the broad range of applications possible with the card, and to complement its standards-based design.

4) That depends on your network configuration. We find that in low-traffic situations, the increase in throughput is not astronomical. Generally, this is because the bottleneck is not how much information can be transferred over the wire, but how much can be processed in and out of the Macintosh. As the total amount of traffic on the ring increases, the capacity of the network becomes more important and 16Mbps token ring begins to perform better than 4Mbps Token Ring.

Operation at 16 Mbps also provides a feature called "Early Token Release," whereby more than one frame may exist on the ring at once. This provides an additional improvement in throughput, especially on large rings carrying a significant number of small frames.

Apple Token Ring 4/16 NB Card: Hardware Q & A

1) How do I set the transmission speed on the card?

2) Why would I want more memory on the card?

3) Can I buy my own memory chips and install them myself?

4) Why would I care about IBM technology?

5) Does the card require special cabling?

This article has been archived and is no longer updated by Apple.

1) The speed setting is software selectable. In fact, the card ships with a Token Ring Control Panel Device (CDEV) that allows you to set the speed setting, the locally-administered address, and timer settings for Response, Acknowledge, and Inactivity. All of these settings can be password protected so users can't change them inadvertently. The settings are saved in a .PREFS file.

2) You might need more memory depending on what applications you want to run on the card.

With the standard configuration of 512K, you can run either TokenTalk 2.4 (for connection to AppleTalk services such as AppleShare file servers or LaserWriter printers) or the SNA*ps 1.1 gateway. In this configuration, SNA*ps can support 8 or fewer 3270 sessions or 4-6 APPC sessions, depending on SNA frame size.

With 1MB of memory on the card, you can support both TokenTalk 2.4 and SNA*ps 1.1. The number of SNA*ps sessions you can support will vary depending on several factors, including the frame size you are using and the number of 3270 vs APPC sessions. As a rule of thumb, 32 3270 sessions or 16 APPC sessions with TokenTalk 2.4 should fit with 1MB of RAM.

With 2.5MB of memory on the card, you will be able to support TokenTalk 2.4 and SNA*ps 1.1 with up to 64 sessions.

3) Yes. The memory is socketed, and specifications for the memory chips are included in the manual.

4) Because the card is built with IBM technology, it's 100% compatible with IBM Token Ring cards. You can mix and match Macintosh and PS/2 computers on a Token Ring without worrying about compatibility. In addition, Token Ring products from other vendors are generally tested for compatibility with IBM Token Ring cards, so the same level of interoperability is afforded Apple's card.

5) No. The card has a standard DB-9 connector for attaching to IBM Type 1 cabling. In addition, media filters are available from third parties so that the card can be used to connect to IBM Type 3 (unshielded twisted pair) cabling. Because the ring interface is made by IBM, the card will operate within the same cabling guidelines as IBM's own products.

Apple Token Ring 4/16 NB Card: Software Q & A

Article Change History

06/28/93 - REVISED
* To include MacTCP Token Ring Extension.

1) Can I use AppleTalk Remote Access with Token Ring now?

2) Does the card still ship with SMB File Transfer software?

3) The new card uses the IBM Token Ring chip set, whereas the TokenTalk NB Card used the Texas Instruments TMS380. Does that mean that I can't run the same software on both cards?

4) What version of SNA*ps runs on the card?

5) Do I need to keep the installer for both the old and the new card? Or will the new TokenTalk installer install a driver for the older card too?

6) Can I run MacTCP over Token Ring now?

This article has been archived and is no longer updated by Apple.
1) Yes. The TokenTalk installer that ships with the Token Ring 4/16 NB Card will include AppleTalk version 57, which is required for AppleTalk Remote Access.

2) No. The SMB software that Apple was shipping prior to June 1991 was incompatible with the latest version of IBM's LAN Server and with System 7.0. Additionally, the Apple/IBM Enterprise Networking Initiative specifies the availability of native AppleTalk AFP support on IBM LAN server products in the future.

3) No. Although the two cards use different hardware, the interface to the LLC task on the cards is the same, so software can be written to run on both cards. For example, you can run the same version of Apple's TokenTalk software, which provides Token-Ring users with access to AppleTalk services, on both the TokenTalk NB Card and the Token Ring 4/16 NB Card. The common TokenTalk software version is 2.4.

4) SNA*ps 1.0 doesn't work on the Token Ring NB Card. You need SNA*ps v1.1. If you are using both TokenTalk 2.4 and SNA*ps v 1.1, you will need at least 1MB of memory on the card. You should order the Apple Macintosh Coprocessor Platform Memory expansion kit (P/N M0145LL/A), or compatible third-party memory, if you are running SNA*ps 1.1.

5) The new software will install drivers for both cards. In fact, the AppleTalk Network Software Installer disk that ships with the card will also install drivers for Apple's Ethernet LC and Ethernet NB cards, as well as the latest version of AppleTalk. This will make it easier for network administrators to manage software for AppleTalk networks because it's all in one place.

6) Yes. Use the MacTCP Token Ring Extension.

SNAps 1.1: Allows Font and Orientation Selection

Does SNA*ps 1.1 printing let me specify the orientation and font for host jobs?

This article has been archived and is no longer updated by Apple.
The user manual for SNA*ps 3287 tells you how to print data that is wider than the page to a LaserWriter. Use the Landscape option in the printing dialogue at 76 percent to allow printing 132 columns by 66 rows. This is the normal 3287 printer paper size.

The "Use custom formatting" option in the Session menu lets you to choose font, size, lines/inch, and other parameters to get the output format as close as possible to your ideal.

Print preview, in the Session menu, lets you preview your output in a separate window.

The font that ships with SNA*ps 3287, called Noiro, is designed to mimic the look of IBM fonts; the custom formatting and preview options should enable you to diverge from the IBM look.

AppleTalk Remote Access: Data Compression

How is compression handled with AppleTalk Remote Access, and is there a way to control it?

This article has been archived and is no longer updated by Apple.

AppleTalk Remote Access does all data compression on the Macintosh. The CCL scripts specifically turn off all data compression in the modem.

AppleTalk Remote Access uses the V.42bis scheme, and the user can't control it.

AppleShare 3.0: Upgrading a Users & Groups File

Using AppleShare 3.0 on a Quadra 900, I want to convert the Users & Groups file from a 2.0 server. Putting the old file in the new server's folder isn't sufficient. How can I get AppleShare 3.0 to recognize the old file?
This article has been archived and is no longer updated by Apple.
We suggest you follow this procedure:

1) Move the Users & Groups file from the Preferences folder to the root level.

2) Put the old AppleShare 2.0 file inside the System Folder, but outside the Preferences folder.

3) Run the Admin program.

4) Enter a new password when the program prompts you for a new Administrator password.

That should convert the old file to the new format.

AppleShare 3.0: Can‘t Log On to the Same Server Multiple Times

I would like to log on to a single AppleShare server, signing on with user name and password to a user's private data volume, but have them log on as "Guest" to a general application volume. The employees here move around to different Macintosh computers frequently, and would like to have a consistent method of accessing information. They have to get to their own "home folders" where ever they are over the internet, but would like to always access an application's volume from the closest local server. Having Guest access available on this computer considerably reduces administration overhead. However, if a user connects to the local server as Guest for an application volume, and their personal "home folder" is on that same server, they can't log on with a different user ID.

Is there any way around this?
This article has been archived and is no longer updated by Apple.
It isn't possible to mount different volumes of a single server with a different user ID and password using AppleShare 3.0. This is a difficult approach using AppleShare 3.0, since it's possible for a physical volume to have multiple mounting points for users, and folders can be share points.

We suggest that users mount their "home folder" first. Then if they need access to a Guest folder on the same server they can easily add it to the existing mounted volume without logging off.

Another possibility is to make each "home folder" user owned. The other folders should have Guest access. When a person logs on as a registered user, they'll also have access to Guest folders.

AppleTalk Remote Access: Don‘t Use at 1200 bps

Is it true that Apple doesn't recommend 1200 bps for AppleTalk Remote Access, and won't provide a 1200 bps script for that product?
This article has been archived and is no longer updated by Apple.
Apple doesn't support 1200 bps because the delay is right at the threshold for timing out.
Published Date: Feb 18, 2012

AppleShare 3.0: Maximum of 346 Open File Control Blocks

AppleShare 2.0.1 limits the maximum number of opened File Control Blocks (FCBs) to 160. This is a problem with some multiuser databases (such as FoxBASE). They open a file for every related database for each user accessing the database from the file server. To allow the maximum number of FCBs, the server had to have a 68O20 or a 68030 processor and have 8MB of RAM.

Does AppleShare 3.0 increase the maximum number of FCBs allowed on the file
server? What is the new maximum number of FCBs? Do the same answers apply to File Sharing?

This article has been archived and is no longer updated by Apple.
AppleShare 3.0's limit is the limit on the number of simultaneous open files under HFS. This is 346 files for both AppleShare and File Sharing.
Published Date: Feb 18, 2012

AppleTalk Remote Access: Uses Portions of Comm Toolbox

I understand that AppleTalk Remote Access doesn't use the Comm Toolbox because of speed issues. Is it possible to change AppleTalk Remote so that it recognizes the extra ports Comm Toolbox allows access to?

I noticed that in the "Remote Access Setup" CDEV that I can see the extra ports, but can't select them. Could you allow the user to select these serial ports? If not, the extra ports should be hidden.

This article has been archived and is no longer updated by Apple.

AppleTalk Remote Access does use portions of the Comm Toolbox. At least one serial card was tested with AppleTalk Remote Access that allows you to select the serial ports on the card. The card is the QuadraLink from Applied Engineering.

QuickTime: Hardware Products Will Have QuickTime Component

Will hardware vendors provide QuickTime components with their products?
This article has been archived and is no longer updated by Apple.
Many companies with hardware products such as video boards, video laser discs, VCRs, compressor boards, and so on, will provide QuickTime components (drivers meeting QuickTime's API specifications). These components provide QuickTime with the code needed to control the device. To some extent, this is similar to how the AppleTalk Manager needn't "know" how to interact with a specific hardware layer because the Link Access Protocol (LAP), and sometimes AppleTalk Address Resolution Protocol (AARP) layers handle it.

Just as AppleTalk programmers aren't concerned with the details of sending and receiving packets over LocalTalk, Ethernet, Token Ring, and so on, software that supports QuickTime isn't concerned with the details of controlling a Sony EVO 9650 Hi8 Edit VCR, or a Truevision NuVista+ video board. These applications only have to know that they're interacting with devices having certain functional characteristics. Some examples of those characteristics include:

- Playing a video segment, stopping, pausing, putting in fast forward or fast rewind mode, and possessing addressable frames.

- Capturing frames (single or sequence).

- Supporting actions such as fade in, fade out, chroma-keying, and so on.

Although all of this information relates to video and video equipment, please note that QuickTime isn't limited to video and/or audio applications. Controlled devices could include scientific and manufacturing equipment.

The important thing to remember about QuickTime is that it is a developer-level technology. It provides software developers with a high-level API for dealing with time-dependent data and devices. It also provides a flexible file format for storing time-dependant data.

QuickTime: Computer Speed Affects Playback

We have noticed with QuickTime a wide disparity of playback caused by dropping of video frames to remain synchronized with sound when moving from one computer to another. Only when we get to Macintosh IIfx speeds do we seem to maintain frame integrity.
This article has been archived and is no longer updated by Apple.
The QuickTime engineers deliberately designed QuickTime to do exactly what you describe. Each computer has limitations of how many instructions it can process in a given amount of time. For QuickTime, this imposes certain performance limitations.

When performance needs exceed performance limitations, adjustments must be made to preserve timing and synchronization. When playing a movie with one or more video and audio tracks, QuickTime drops video frames to preserve timing and synchronization. This solution is much less damaging to the presentation than dropping audio segments.

There are several factors that contribute to the performance that you observe when playing QuickTime movies. Some of them are:

- The CPU (68020, 68030, 68040, or PowerPC) and its clock speed

- The number of tracks played at one time

- The precision of the data within each track (examples: bits/pixel, pits/audio sample)

- The background processes that run at playback time (examples: VBL tasks, drivers, file sharing, and so on)

- AppleTalk network traffic. (Each Macintosh partially inspects EVERY packet that comes by to determine whether the packet was addressed to it.)

QuickTime: Writing a Compressor/Decompressor

Does the QuickTime architecture (specifically PICTCompressor) support/import/export TIFF or TARGA images? I need to work with these files in addition to PICT file format, and would like to see the current compression ratios under QuickTime.

Could a TIFF or TARGA Compressor be written using the QuickTime Toolbox, or is it PICT specific?

This article has been archived and is no longer updated by Apple.

One of the benefits of QuickTime is that it was designed to be a very open-ended developer technology. So when you ask if QuickTime is PICT specific, the answer is a strong NO. However, any given compressor/decompressor (CoDec) component will usually be specific to a specific data format such as PICT, TIFF, TARGA, and so on. You could write a TIFF or TARGA CoDec, provided you have the expertise to do so.

QuickTime: Application Can Choose Sound Track, or Choose None

Can I turn off the sound as something plays back?
This article has been archived and is no longer updated by Apple.
Each QuickTime movie file can have any number of tracks within the file. When the file is played, the application software explicitly "tells" QuickTime which tracks to play. For example, you could have a movie file with one video track and one audio track for English narration, one audio track for Spanish, another for German, and so on.

On playback, the application could check to see what language the System is in, and play only the appropriate audio track. The application could also play NO audio tracks if desired. This functionality is an application feature; QuickTime just offers the support for achieving it.

Apple Keyboard II: How It Differs from Previous Apple Keyboard

The Apple Keyboard II (M0487LL/A) replaces the stand-alone Apple Keyboard (M0116). This article describes the differences between them.

This article has been archived and is no longer updated by Apple.
The Apple Keyboard II, which has been shipping with the Macintosh Classic and Macintosh LC, is fully ANSI and ISO compliant.

New Key Layout

Several keys were relocated. The caps lock and control key exchanged places. The tilde key is now where the escape key was. The vertical line key was moved to a new location above the new return key, and the escape key took the vertical line's old spot. The return key was made smaller, and the space bar was enlarged.

The international ISO version has a new key with ▒ and ñ characters and the escape key replaced the right-hand side command key. The space bar was enlarged.

Both keyboard's numeric keypads have the + and - keys reversed. It is the same as the extended keyboard. In addition, this is the same arrangement as a 10-key adding machine.

With the exception of the arrow and escape keys, Apple Keyboard II has a layout which is identical to the comparable parts of the Apple Extended Keyboard II.

Tilt Legs

At the ends on the back, the keyboard has two legs the user can extend to provide a greater tilt.

PowerBook: Making Cable Connections While In Sleep Mode (3/95)

Is it safe to make cable connections, such as ADB, Serial, SCSI, or SCSI Disk Mode, to a PowerBook when it is in Sleep mode?

This article has been archived and is no longer updated by Apple.

ADB

It is safe to make ADB connections to a PowerBook when in Sleep mode.

Serial

It is safe to make a serial connection to a PowerBook when in Sleep mode though it may require a restart to recognize the device.

SCSI

It is safe to make SCSI connections to a PowerBook when in sleep mode. However, you may need to restart the PowerBook or use a utility such as SCSI Probe to force the PowerBook to recognize the device.

SCSI Disk Mode

If you accidentally connect the SCSI disk adapter to a PowerBook while it's in sleep mode, you'll get a warning dialog box when you wake it.

You must first turn off the PowerBook when connecting the SCSI disk adapter. The SCSI disk mode firmware is only executed from a cold start.
NOTE: All PowerBook models support SCSI Disk Mode with the exception of the PowerBook 140, 145, 150, and 170.

If you connect the cable while the system is in sleep mode, there will be conflicting SCSI IDs on the bus and potential data loss. There are two methods to exit this state:

-You can shut down the system by pressing the reset and interrupt (programmer's) switch

-If there's data in RAM that you need to save, you can disconnect the SCSI disk adapter to resume normal operations (that is, the dialog box will go away).

Note: The PowerBook 100 User's Manual incorrectly advises the user to shut down the system using the Shut Down command from the Special menu. It is not possible to do this since the menu bar is disabled when the warning dialog box is showing.

Article Change History
29 Mar 1995 - Updated to include all cable connections to PowerBook.
18 May 1994 - Clarified PowerBooks which do NOT support SCSI disk mode.
30 Jun 1993 - Updated to include all PowerBook models to date.

PowerBook 100: Deactivate AppleTalk if Modem Uses Printer Port

You can use the printer port to connect an external modem. However, remember to deactivate AppleTalk in the Chooser before using the external modem.

This article has been archived and is no longer updated by Apple.
You may use the PowerBook 100 printer port to connect to a printer or LocalTalk network, and also to add external serial devices such as a modem. However, when disconnecting from a LocalTalk network and connecting a device like an external modem, be sure to deactivate AppleTalk in the Chooser. If you don't, you'll typically get some kind of serial port error message.

PowerBook 100: RAM Expansion Card Compatibility 8/92

What memory cards can I use in the PowerBook 100?

This article has been archived and is no longer updated by Apple.
You can use Apple PowerBook memory cards (2MB or 4MB cards) in any of the Macintosh PowerBooks.

However, third party cards designed for the Macintosh PowerBook 140 and 170 are not necessarily compatible with the PowerBook 100 because the 68000 has a 16-bit data path, whereas the 68030 can handle 32 bits. The PowerBook 100 requires additional signal lines on the memory card to do addressing correctly. In addition, the physical form factor may not be the same.

System 7 Tune-Up 1.1.1 Feature Summary

This article describes the changes made to System 7 with Tune-Up.
This article has been archived and is no longer updated by Apple.
This version of System 7 Tune-Up addresses the issue of disappearing files and folders reported by some users running version 7.0 and 7.0.1. It also includes LaserWriter driver version 7.1.1.

LaserWriter 7.1.1 driver provides the following benefits:

* Support for the Personal LaserWriter NTR
* It fixes an issue that causes a compatibility issue between the current driver (7.1) and the LaserWriter Plus.
* A workaround for a bug in the LaserWriter IIf and IIg ROM that causes PostScript errors (under certain conditions) when printing TrueType.

Improved System Behavior In Low Memory Situations

* Fewer Memory Size Alerts
When you open an application, if the available memory is less than the application prefers, but more than its minimum requirement, the application will use the available memory. Memory size alerts such as "Application prefers 1024K of memory, 900K is available, do you want to open using available memory?" won't appear.

* Closed Applications Quit Automatically When More Memory Is Needed
Users commonly get into low memory situations by closing a document window without quitting the application, letting the application remain in memory. With the System 7 Tune-Up installed, the Finder offers to quit such applications automatically to make enough memory available when opening another application.

* Automatic Printing Without Quitting The Application
This helps when you choose "Print ╔" with background printing on, and there isn't enough memory available to use PrintMonitor. System 7 Tune-Up will print the document immediately, without making you quit the application.

* Reduced System Software Memory Consumption When AppleTalk Is Off
If you turn off AppleTalk with the Chooser and then restart, AppleTalk networking code won't be loaded into system memory. This frees up 100K to 125K, depending on the Macintosh model. If AppleTalk is turned on again with the Chooser, you must restart to use networking services.

* Reduced System Software Memory Fragmentation
As you open applications, desk accessories, and control panels, the amount of memory used by system software increases. Issues in the System 7.0 and 7.0.1 Memory and Process managers prevent some of that memory from being released when those programs quit. System 7 Tune-Up fixes those issues, so more memory is released when applications and desk accessories quit.

Performance Enhancements

* Faster LaserWriter Performance When Printing TrueType Fonts
LaserWriter driver version 7.1 doesn't download software or fonts to the LaserWriter IIf, IIg, IINT, and IINTX if the software or fonts are already in the printer's ROM. This speeds printing of both TrueType and Type 1 fonts. It also doesn't download TrueType software and fonts to the LaserWriter and LaserWriter Plus. Instead, it converts TrueType fonts to Type 1 format and downloads those.

* Faster StyleWriter Performance
StyleWriter driver version 7.2.2 is nearly twice as fast as version 7.1, because it was rewritten based on the Personal LaserWriter LS driver rather than the ImageWriter driver. Now StyleWriter users need the MS Word TrueType Printer INIT from Microsoft to print Microsoft Word documents correctly on the StyleWriter printer.

* Better Font Memory Management
TrueType software uses an area of system software memory to store the most recently used font images. System 7.0 and 7.0.1 clears this area out whenever any new file is opened. TrueType must then refill this memory, slowing performance (especially when printing). With the System 7 Tune-Up, the system clears this memory area only when a new font file is opened, increasing font performance in general and TrueType printing in particular.

* Faster Chooser Performance
Chooser 7.1 displays device names faster. Keyboard shortcuts in the Chooser also select devices more quickly. Improvements are most noticeable in network zones with many devices.

* Faster Finder Copying Of Large Files
System 7 Tune-Up improves the performance of Finder "move" and "duplicate" operations by up to 20% on files over 200K.

Bug Fixes

* Reduced Possibility Of Data Corruption With Shared Files
An issue in System 7.0 and 7.0.1 makes it possible for File Sharing files to become corrupted when two or more users access the file simultaneously. File Sharing Extension 7.0.2 fixes this issue.

* Increased PrintMonitor Reliability
System 7 Tune-Up makes Print Monitor more reliable and much less prone to crashes.

* Bitmapped Fonts In the System File Marked As Purgeable
System 7 Tune-Up allows the Font Manager to unload certain fonts in the System 7.0 System File from system software memory when not in use.

* Aliases to the Trash
System 7 Tune-Up fixes occasional strange behavior of aliases to the Trash.

* SCSI Manager
With System 7.0 and 7.0.1, using serial communications devices during heavy File Sharing activity can cause the SCSI bus to become confused and seem busy when the bus is free. This causes the computer to hang. System 7 Tune-Up fixes this issue.

* Sleeping Keyboard
At startup, the System 7 Tune-Up repeatedly resets Apple Desktop Bus keyboards, preventing an issue in which some keyboards occasionally fail to wake up. System 7.0.1 includes this fix as well.

TA47907_Apple_Inch_Color_Display_Compatibility_(TIL09454).pdf

Apple 16-Inch Color Display: Compatibility

The Apple 16-inch Color Display works with Quadra 700 and 900 internal video. Other Macintosh II systems require a display card.

This article has been archived and is no longer updated by Apple.

Quadra Built-in Video

The Quadra 700 and 900 built-in video provides 256 colors in the base configuration, and 16.7 million colors with expanded VRAM.

Display Cards

The Apple 16-inch Color Display works with the Macintosh Display Cards 8*24 and 8*24 GC, version B or later. (If you have one of these cards and it's earlier than version B, you can have the ROMs upgraded.)

The number of colors provided by the Macintosh Display Cards are as follows:

Macintosh Display Card 8*24 256 colors
Macintosh Display Card 8*24 GC 32,000 colors

Macintosh Communications Toolbox: Software That Uses It

We want an application that uses the Communications Toolbox. We've considered MicroPhone and HyperCard. Do you know if the Macintosh Communications Toolbox works with MPW C? Will it work with any other development environments particularly well?

This article has been archived and is no longer updated by Apple.

Applications

Many applications that use the Communication Toolbox are available. Terminal emulator programs such as PacerTerm and VersaTerm-Pro use the Communications Toolbox. Software Ventures told us that the current MicroPhone II v3.0 doesn't support the Communications Toolbox. The future release (v4.0) will support the Communications Toolbox Connection Manager.

HyperCard

For HyperCard development, APDA has the HyperCard Macintosh Communications Toolbox Toolkit v1.0b2. This toolkit contains everything you need to access the facilities of the Communications Toolbox from HyperCard. In addition to the external commands (XCMDs) and external functions (XFCNs), the toolkit provides a complete set of documentation, and the full source code for the XCMDs and XFCNs.

NOTE: This product is compatible with HyperCard 2.0, with one known exception. When you open a window, the second window can't open any larger than the first window because of the way both applications allocate memory. This is the only known incompatibility. This is a restricted product. Please call APDA for more information.

MPW

MPW 3.0 and later development platforms support the Macintosh Communications Toolbox. MPW 3.2 supports the Macintosh Communications Toolbox interface files for System 7 and includes the Communications Tools Scripting Interfaces. You can also use third-party platforms that convert MPW interface files and object files.

To locate a vendor's address and phone number, use the vendor's name as a search string in the Tech Info Library.

TA47909_KanjiTalk_Printing_to_StyleWriter_(TIL09459).pdf

KanjiTalk: Printing to StyleWriter

Article Change History

09/22/92 - UPDATED
* To include information on Kanji TrueType.

Can I print Kanji to a StyleWriter using a Macintosh Classic with 2MB or 4MB RAM, KanjiTalk system software, and a serial connection to a StyleWriter?

Specifically:

1) Can I print Kanji and Roman characters on the StyleWriter?

2) Will the quality be bitmapped (72 dpi) or TrueType (300+ dpi)?

3) Is this possible and/or practical on a 2MB Classic?

This article has been archived and is no longer updated by Apple.
1) Yes, you can print Kanji and Roman characters on the StyleWriter.

2) Without an outline font technology, such as Kanji TrueType, The output isn't pretty due to bitmap fonts (Adobe's ATM-J can help improve the output). Kanji TrueType, is also available in the U.S. through KanjiTalk authorized dealers.

3) A Macintosh Classic with 2MB RAM is fine for the current release of KanjiTalk, 6.0.7. However, you will need 4MB if you install Kanji TrueType or ATM-J.

For a list of authorized KanjiTalk dealers in the U. S, search the Tech Info Library under "KanjiTalk and dealers", or contact the Apple Dealer Location Operator at 800-538-9696.

MacTerminal and Macintosh-to-VAX Connectivity

I need to connect approximately 300 Macintosh workstations (on LocalTalk) to a VAX/VMS system using FastPath 5 routers. Only 50 or so simultaneous sessions need be supported. I am looking for software that will allow this to happen.

Currently, all the Macintosh computers have MacTerminal 3.0 and are accessing through a serial connection. I would like to retain the substantial investment we have in MacTerminal.

A product like TSSnet sounds like it will do the job. Are there comparable products that do not include a terminal emulation package (as TSSnet does)?

This article has been archived and is no longer updated by Apple.
There are many options to connect Macintosh computers on LocalTalk to a VAX. However, since you already own MacTerminal 3.0 and want to retain that investment, this list narrows down a bit. One option is software from Synergy described here:

VersaTermServer is a Macintosh CommToolBox-based application which allows any Macintosh to act as terminal server. It supports 24 output ports, and two different input methods. Inputs can be AppleTalk ADSP Tool over LocalTalk, VersaTerm Telnet Tool over Ethernet, and Apple Modem Tool over serial line. Outputs can be LAT Tool to VAX hosts, Telnet Tool to UNIX hosts, or Modem and Serial Tools. Your Macintosh computers on LocalTalk can use the AppleTalk ADSP Tool to the VersaTermServer, and then LAT from the Server to the VAX. Each supports 24 output ports so you will need two servers running.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

DAL for MVS/VTAM: SNAps Over Token Ring

We run SNA*ps over a Token Ring connection to an MVS/VTAM host. We'd like a DAL Server for MVS/VTAM to access through the Token Ring network with LU6.2 protocols (APPC).

Will the Token Ring connection work for DAL access with SNA*ps to an MVS/VTAM environment?

This article has been archived and is no longer updated by Apple.
DAL engineering lab is using this exact configuration, and it should work. We recommend defining a larger RU size in the Mode Table Entry so you can send a larger block size. You should be using SNA*ps version 1.0.1 or later. See the member READ ME in the DAL.RUN.JCL library on the installation tape for additional information.

Direct-To-1: Translation Between All-in-1 and MacWrite

We're running a VAX-based server with PCs and terminals, and plan to add Macintosh clients. We communicate worldwide over a VAX network using All-in-1 mail and word processors. We're considering PATHWORKS for Macintosh to turn the VAX into a server for the Macintosh.

One of our major requirements is to download All-in-1 documents to use in a Macintosh word processor such as MacWrite. After some tailoring with MacWrite, we need to load the document back to the VAX as an All-in-1 document.

I understand MacLink Plus/Translators from Dataviz contain a translator called WPS-Plus VMS. Will this translator work between an All-in-1 and MacWrite document?
This article has been archived and is no longer updated by Apple.
Digital confirmed that WPS-Plus format is different and the translator won't work with All-in-1.

We found the following product information:

Direct-To-1 allows users to send Macintosh files to other All-In-1 users with a Macintosh 512KE or later; Reflection V3.4 or later; Digital VAX All-In-1.

Direct-To-1 is a utility for the Digital VAX that allows Reflection users to send Macintosh files to other All-In-1 users. When used with Walker Richer & Quinn's Reflection 2 for the Macintosh, users can send a variety of file formats over any supported asynchronous or network connection to a VAX host. Direct-To-1 offers convenience and security features that make All-In-1 a effective communications tool for business users.

DAL: No Record Size Limit

What is the byte limit for the length of a variable-byte-length record in DAL? Where can I get answers to similar questions?
This article has been archived and is no longer updated by Apple.
There is no limit to the size of record support by the DAL server. VARCHAR data types (as with a column of type VARCHAR) can be of any length. However, DAL can't return to the DAL client a VARCHAR larger than 255 characters. Using the @substr function, you can return a very large VARCHAR in several substrings.

This information isn't in the current manuals. For similar questions, refer to the DAL Programmer's Reference, or the DAL Application Developer's Guide.

MacTerminal 3.0: 3278 Terminal Emulation Tool

I have MacTerminal 3.0, and want to connect, via coax, to a 3174 controller in the building. MacTerminal 2.3 and its built-in 3278 emulation did this easily in the past.

Can I get 3270 terminal and connection tools and, simply by adding them to "vanilla" MacTerminal, get my 3270 access?

This article has been archived and is no longer updated by Apple.
The only Tool we are aware of is asc3270 from Advanced Software Concepts, which offers 3270 terminal emulation via the CommToolBox. Currently, it only supports telnet connections over TCP/IP using their TCP/IP connection Tool called TCPack.

Since you already have coax to a 3174 controller, SNA*ps is a better solution since it provides better keyboard mapping and terminal emulation. If you insist on using MacTerminal, you will have to wait for the SNA connection Tool from Advanced Software Concepts.

Other 3270 connection solutions are also available in the Technical Info Library. Search using keyword "Macintosh and 3270."

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

LaserWriter IIf & IIg: Configuration and Parameter Info Sheet

When I upgraded the RAM in a LaserWriter IIf from 2MB to 5MB, the LaserWriter Serial Number changed. Why is this?

This article has been archived and is no longer updated by Apple.
The LaserWriter Serial Number on the Printer Configuration and Parameter Information sheet is random, and changes every time a LaserWriter IIf or IIg is turned off and on.

Published Date: Feb 18, 2012

LaserWriter IIf: Needs 4MB RAM to Print All Page Sizes

The manual for the LaserWriter IIf and LaserWriter IIg states that there is a non-printable margin around the page of 5mm. All of the LaserWriter IIf printers I've printed on have an unprintable area of: top=10mm, bottom=10mm, left=10mm, right=6mm.

This article has been archived and is no longer updated by Apple.
The LaserWriter IIf and LaserWriter IIg have a non-printable margin of 5mm around the page. The problem you have is due to a lack of memory in the LaserWriter IIf. The largest page size a 2MB LaserWriter IIf can print is a4small, which is 7.68 by 11 inches. The default page size that is used is lettersmall, which is 7.89 by 10.30 inches. A 2MB LaserWriter IIf can't print a letter size (8.11 by 10.79 inches), or legal size (8.11 by 13.79 inches) page. The only way around this is to upgrade the memory of the LaserWriter IIf to 4MB.

A 4MB LaserWriter IIf can print any of the following page sizes:

legal: 8.11 by 13.79 inches
a4: 7.89 by 11.44 inches
letter: 8.11 by 10.79 inches
a4small: 7.68 by 11 inches
lettersmall: 7.89 by 10.30 inches
b5: 6.72 by 9.81 inches

3M DC2000 Tape Cartridges: Storage and Longevity

What is the storage life of DC2000 tape cartridges? How long we can safely store a cartridge without losing the data?
This article has been archived and is no longer updated by Apple.
Our answer is from the 3M Recording Products Division Hotline. They don't state the probable maximum life-span of data stored on a DC2000 tape cartridge. They advise that the tape be retensioned every year, and to rewrite the data out onto the tape every 5 years.

Note: To rewrite the data onto a tape cartridge, you'll probably need to restore the data to a hard disk, then back up that hard disk again. All previous mention of how to properly store the tape applies.

Backups
The tape cartridge life-span can be greatly influenced by the environment you store and use it in, as well as whether you back up the tapes by volume or by file.

Volume:
If you back up tapes by volume, your cartridge may last for a couple thousand backups. This estimate isn't based on any controlled study. It's based on the assumption that during a volume backup, after the initial tensioning of the tape, the drive will generally record information on the tape from the beginning to wherever it stops once it completes transferring all of the information. This is usually in one or two continuous passes. Incidentally, the noise (pitch and volume changes) the drive makes when performing a volume backup isn't from the drive stopping the tape, rewinding it, then proceeding forward. The drive generates this noise when it switches tracks.

File:
Backing up onto the tapes by file is much more stressful on the tape. When the files are fragmented on the drive, the drive may have to reverse direction of the tape many times to lay the files down sequentially on the tape. We are unable to predict the longevity of a tape used for file backups. These three factors influence longevity:

- The great variation in the quantity of files backed up
- The differences in file size
- Degree that files are fragmented

However, prudence should dictate practice when archiving data.

Operating Environment
The operating environment also influences the tape life. Before using the cartridge, allow it to acclimate to your operating environment for eight hours, or for the amount of time it has been exposed to dissimilar conditions -- whichever is less. Recommended operating environment:

Temperature: 41 to 113 degrees F (5 to 45 degrees C)
Relative Humidity: 20 to 80% non-condensing
Maximum Wet Bulb Temperature: 79 degrees F (26 degrees C)

Store tapes out of the direct sunlight and where they won't be exposed to high temperatures.

SNAps 3270: Macintosh Quadra Installation and Compatibility

I'm unable to get the SNA*ps software to run on a Macintosh Quadra 900. I turned off all the INITs except the SNA INITs and still can't get the program to run without crashing. I have turned 32 mode off/cache off and every combination in between. Is there a known problem? If so, is there a fix in the works?

This article has been archived and is no longer updated by Apple.
SNA*ps 3270 v1.0.1 (the client software) is compatible with the Macintosh Quadra computers. However, you may have done an Easy Install or a Custom Install, and selected SNA*ps CUT and SNA*ps NLCA. In this case, you must remove the extensions, SNA*ps CUT, and SNA*ps NLCA from the Extensions folder. These extensions aren't compatible, and SNA*ps 3270 will hang when you launch it.

The preferred way to install SNA*ps 3270 on a Macintosh Quadra is to do a Custom Install and Choose "SNA*ps 3270 Client, System 7."

The original Macintosh Quadra compatibility booklet distributed with the Macintosh Quadra computers and the compatibility report posted on AppleLink say that both SNA*ps Gateway and SNA*ps 3270, versions 1.0 and later, are compatible with Macintosh Quadra computers. Only SNA*ps 3270 is compatible if you follow the above guidelines.

Note that only a few copies of SNA*ps 3270 version 1.0 were distributed before SNA*ps 3270 was revised to version 1.0.1. There are no functional differences, only a cosmetic one with one dialog.

System 7.0.1: Change Overview

Article Change History

09/25/92 - REVIEWED
* For technical accuracy.

This article describes the differences between System 7.0 and 7.0.1. They fall under two main headings:

- cdevs/Extensions

- System File

This article has been archived and is no longer updated by Apple.

CDEVs/Extensions

Memory

RAM Disk Support on Quadra and PowerBook Computers Support for RAM Disk on the Macintosh Portable was moved from the Portable control panel to the Memory control panel. Minor internal changes were made to all of the "panels" inside memory. Specifically, the virtual memory and RAM Cache "panels" were updated to work correctly with the new RAM disk and to work with the existing RAM disk on Macintosh Portable computers. The previous version of the Memory control panel would let users reduce the size of the virtual memory backing store (by reducing virtual memory). This change would take effect before restarting. This was corrected under 7.0.1 to occur at restart.

Portable

The screen brightness and contrast sliders previously found in Portable were removed. The PowerBook family has hardware controls on the front to control contrast and brightness. For the Classic family, Macintosh Portable, and PowerBook 100, a dedicated control panel called "Brightness" provides control of the overall screen brightness. RAM disk controls for the Macintosh Portable previously found in Portable have moved to Memory.

Portable supports internal modems in PowerBook 140 and 170 as well as in the Macintosh Portable.

Brightness

The brightness control panel supports Macintosh Portable, Classic, Classic II, and PowerBook 100 computers. The control panel is a simple slider that controls overall screen brightness.

Network

Minimal Network changes support on-board Sonic Ethernet for the Quadra family.

Battery

Battery was updated to work with the PowerBook family. Battery now

provides users with a button to put the computer to sleep immediately.

Caps Lock

The Caps lock indicator panel places a visual indicator of the state of the Caps Lock key on the right end of the menu bar. Available only on PowerBooks.

File Sharing Extension

An internal 4K file sharing buffer was increased to 5K. With the increased performance of the Quadra family's built-in Ethernet, a slightly larger buffer increased the file sharing throughput by 2 times on those computers.

Cache Switch

There's a new control panel for the Quadra computers to disable or enable the 68040 cache. The control panel simply sets a PRAM byte and the System does all the work at the next startup.

A/ROSE and DAL

General 68040 compatibility changes.

HD SC Setup

Minor changes to support new hardware and to change a format-time mode select.

System File

OS

- Keyboard patch wakes up sleeping Putter (Macintosh Classic) keyboards.

- Supports the 53C96 SCSI chip found in the Quadras and PowerBooks 140 and 170. At startup, a linked patch was added to wait for all SCSI drives connected at the previous startup to spin up before continuing the launch. This is for Macintosh Quadras and PowerBooks 140 and 170 only.

- Minor LocalTalk changes for 68040 compatibility.

- Minor changes to Gestalt 'lram', 'ram ', and 'kbd ' selectors for RAM disk/PowerBook keyboard support.

- Updated _hwPriv CPU cache management and dispatch routines.

- Updated keyboard maps for Key Caps (PowerBook keyboard).

- Supports the new Macintosh PowerBook 140/170 power manager.

- Startup code inhibits 68040 cache depending on setting of Cache Switch CDEV.

- Bitmapped system fonts were marked unpurgeable in System 7.0. These are now marked purgeable under 7.0.1.

ToolBox

- SANE (Standard Apple Numerics Environment) performance was improved via backpatching. The new SANE is functional on all computers with a IIci class universal ROM and a Floating Point Unit. It's occasionally noticeable in applications that use SANE on computers with a FPU.

- The Disk Initialization Package now creates an MFS disk when the size of the volume is exactly 800 blocks (400K), instead of doing so on sizes less than or equal to 800 blocks. This is to prevent RAM disks that are smaller than 800 blocks from being formatted as MFS volumes. It is impossible to create a RAM disk with exactly 800 blocks.

- The Notification Manager has been changed to call IdleUpdate when NMInstall is called (on portables) to wake the system up when a notification is about to be posted.

- Enables powerdown messages on Quadra 900 and RAM disk. The warning code, "has files on it and will be erased if you shut down" was added to the Shutdown Manager. Also, all open video drivers are closed before the power is killed at _Shutdown.

- Support for Quadra and PowerBook sound hardware and internal sound input source selection was added to the Sound Manager.

- The backlight driver was upgraded to work with the PowerBook family.

- SetHandleSize was fixed for all 32-bit memory managers.

General

- Various strings and dialogs, required in the support of the new systems, were added.

- Several minor changes that reduce the overall size of the run time system heap were made to compensate for the memory required by the new CPU support.

- The Installer script file has been substantially revised to address the needs of the new systems.

Macintosh Quadra: How On-board Ethernet Differs from Ethernet NB

Does the built-in EtherTalk capability on the Quadra systems have the same functionality as the Ethernet NB Card?

This article has been archived and is no longer updated by Apple.
The Quadra's on-board Ethernet has the same functionality as the Ethernet or EtherTalk NB card. But it's about 15-20% faster because it uses DMA, doesn't rely on NuBus data transfers, and the chip is operating at the faster system bus clock rate.

The Quadra's on-board Ethernet is implemented using the National DP83932 SONIC Ethernet controller chip. This device includes an IEEE 802.3 encoder/decoder (ENDEC), media access control (MAC) unit, separate 32-byte send and receive FIFOs, and DMA controller in one device. SONIC is housed in a 132-pin PQFP package. A small ROM provides the Ethernet global address (which provides a unique 48-bit identity for each Quadra built). The SONIC controller includes DMA capability. It will request the bus and transfer data between its internal registers and main memory.

The Apple AUI (AAUI) connector provides outside connection. The AAUI connector is compatible with any of the FriendlyNet drop boxes that provide transceivers for thick net, thin net, or 10BaseT networks.

MacX: Difficulty Sending Application from HP Server

I'm having a problem sending a MacX application to a Macintosh with the new HP 730 (75 Mip server).

Configuration:

- Macintosh IIci
- 8MB memory
- 80MB disk
- Ethernet over twisted pair
- System 7 with MacX 1.1.7
- MacTCP 1.1
- MacTCP Tool 1.1.7

I've tested the above system with a DEC VMS system and it works fine. I can even Telnet into the HP server from the Macintosh. I can send the MacX application to an HP X terminal. But I can't send it to MacX. I've used the standard commands such as "setenv DISPLAY 1.1.1.1:0" and "xterm 1.1.1.1:0" and almost anything else I can think of.
This article has been archived and is no longer updated by Apple.
After a Macintosh successfully sends to the HP server, try the following command (assuming that X.X.X.X is the Macintosh IP address).

root#	/usr/bin/X11/xterm -display X.X.X.X:0.0
root#	setenv DISPLAY X.X.X.X:0.0; xterm (root is running csh)
root#	env DISPLAY=X.X.X.X:0.0 /usr/bin/X11/xterm (root is running sh)

In MacX, try running any of the above commands from the Remote menu. If it works from the HP server to the MacX, but fails from the MacX to the HP server, then you must have a networking permission related problem from MacX to the HP server. We've seen this scenario in a SunOS host which implemented a feature in the "rexecd" code that doesn't allow a host that isn't listed in the /etc/hosts file or YP (now called NIS) name server to execute the "rexecd" command. The solution for it is to add the Macintosh IP address and host name to the Sun's /etc/hosts file or the NIS name server. We suggest that you check this with the HP server to see if it has the same problem.

A/UX: Increasing Maximum Open Files per Process

Article Change History

08/31/92 - REVIEWED
o For technical accuracy.

Is there a way to increase the maximum number of files that one A/UX process can open simultaneously?

Normally the maximum is 32 (and this includes stdin, stdout, and stderr). In stdio.h we found the identifier FOPEN_MAX, but modifying this isn't sufficient. We also found the identifiers OPEN_MAX in limits.h and NOFILE in sys/params.h. However, modifying these identifiers to a higher value (for example 40) in our own source doesn't work either.

Is it possible that these values are fixed in certain system libraries or in the object code of the system calls (open, creat)? Is there an easy way to change this, both in A/UX 2.0.1 and 3.0?

This article has been archived and is no longer updated by Apple.
There is no way to adjust the number of open files available to each process without recompiling the kernel, because it was hard-coded in the kernel. If you try to use "adb" to change this value, other kernel structures will be affected and mixed. You won't be able to recompile the kernel without kernel sources.

The upcoming A/UX 3.0 release increases the maximum number of open files per process to 128. These defined constants, OPEN_MAX (in /usr/include/limits.h) and NOFILE (in /usr/include/sys/param.h), are in A/UX 3.0

CodexEvents Library: Apple Events For UNIX

On November 18, 1991, Codex Software Development Pty. Ltd. of Melbourne, Australia announced the development of CodexEvents. This is an Apple event style library for providing interapplication communications facilities between Macintosh, UNIX, and Microsoft Windows systems.

This article has been archived and is no longer updated by Apple.
Developers can use the CodexEvents library to send messages between independent programs running on different computers. The library is compatible with the Apple events API defined by Apple Computer, Inc. for use with the Apple events messaging protocol. For each Apple event call there is a corresponding CodexEvent call. Thus, it requires very little effort to convert code that uses Apple events to use CodexEvents instead.

"For the first time, we have a truly platform independent messaging protocol which is high level enough to be useful." said J. Matthew Pryor, Director of Software Technology at Codex. "CodexEvents makes writing cross-platform software feasible, by providing a standardized, high level messaging protocol for programmers on Macintosh, UNIX or Windows platforms."

Codex has also developed a background application for the Macintosh which allows a non-Macintosh application to send Apple events to applications running on the Macintosh. This application acts as a protocol converter for incoming CodexEvents, translating them into Apple events which Apple event-aware applications, such as the Macintosh Finder or Microsoft Word, can respond to directly.

CodexEvents is currently available for SunOS, NeXT and Macintosh. The Macintosh library operates under both System 7.0 and also under System 6.0.5 or later. So developers can use CodexEvents to add interapplication messaging facilities to their non-system 7.0 applications.

CodexEvents currently requires MacTCP to be installed on each Macintosh and TCP/IP protocols to be available on the non-Macintosh computers. CodexEvents is engineered to be network independent however, and versions which use Novell, 3Com and AppleTalk are under development.

Parties interested in licensing CodexEvents should contact Brett Adam of Codex.

Codex Software Development was founded in 1989 with the express purpose of developing cross-platform software technology and innovative software products for the general marketplace.

This information is provided by the product's developer or distributor and constitutes neither an endorsement nor a recommendation by Apple Computer, Inc.. Apple assumes no responsibility with regard to selection, performance or use of this product. All understandings, agreements and warranties, if any, take place directly between the developer and the prospective user.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

A/UX: Changing Slice Number with dp (8/94)

I have a problem with my A/UX hard drive (Micronet 400MB with all the database software). The drive was partitioned into 11 partitions, for example:

Swap : slice 1
Ingres : Slice 2
Oracle : Slice 3
Informix : Slice 4

Now I have several different partitions with the same slice number: slice=3. The partitions map seems to be OK (blocks, type of partition, and so on), except the slice number. Do you know if it's possible to change the slice number of a partition by using the dp command, and without losing the information?

This article has been archived and is no longer updated by Apple.
First, make sure all partitions' physical starting locations don't overlap.

Suppose your Micronet disk drive's SCSI ID is 5, and has two disk partition entries (5 and 6) with the same slice number 3, and you want to change entry 6 with the new slice number 8. Log in as root and do the following:

```
# dp /dev/rdsk/c5d0s31
--->Command? p6 <===== Your input # view partition entry 6
--->Command? c6 <===== Your Input # change partition entry 6
--->DPME Field? b <===== Your Input # change BZB
--->BZB Field? s <===== Your Input # change slice number
--->Slice number + 1 [3]: 9 <===== Your Input # assign slice number 8
Note: [3] indicates the current slice number
--->BZB Field? q <===== Your Input # quick BZB mode
--->DPME Field? q <===== Your Input # quick DPME mode
--->COmmand? w <===== Your Input # write changes
--->Command? q <===== Your Input # quick dp
#
```

Note that the s slice number (bzb_slice) command in the BZB-field mode isn't documented in either dp(1M) hard copy document or the dp(1M) on-line manual pages.

Applesoft: Commas and printing

The following information applies to the Apple II Plus with a 40-column screen.
This article has been archived and is no longer updated by Apple.
The third comma tab field is only available if there is nothing beyond column 23. The first character in the third comma field can print outside the text window.

HTAB can force the cursor outside the text window which can kill a program on the next PRINT statement.

VTAB ignores the text window. VTABbing below the text window will cause all output to be on one line. VTABbing above the text window will scroll into the window but the area above the window won't scroll.

Macintosh: Files Required to Play Audio CDs

Every time I insert an audio CD into the AppleCD attached to my Macintosh computer, a dialog appears asking if I want to initialize the CD.
This article has been archived and is no longer updated by Apple.
You are missing one or more of the system extensions needed to play audio CDs.

With System 7.1 and later, these files must in the Extensions folder:

- Apple CD-ROM
- Audio CD Access
- Foreign File Access

The AppleCD Audio Player is an application, so it can go anywhere on your hard disk. However, if it is in the Apple Menu Items folder, you can easily access the AppleCD Audio Player from within any application.

If you have an AppleCD 600, you need to use v5.0.4 or later of the Apple CD-ROM extension.

System 7.x: Limitations on Use of 400k Disks

This article contains the following questions and answers.

1) What is meant by MFS disks?
2) What are HFS disks?
3) With the introduction of HFS disks was it still possible to format disks as MFS?
4) How did the introduction of System 7 affect the ability to read and write to MFS disks?
This article has been archived and is no longer updated by Apple.
1) Question: What is meant by MFS disks?

Answer: The first Macintosh computers used only 400k single-sided disks, formatted as MFS (Macintosh File System) volumes which used a flat file structure, and no subdirectories (folders in Macintosh vocabulary). Although you could create and place documents and folders into folders, they existed only in the Finder's view of the disk.

2) Question: What are HFS disks?

Answer: With the introduction of HFS (hierarchical file system) and 800k, double-sided disks, the concept of subdirectories (folders) came to the Macintosh.

3) Question: With the introduction of HFS disks was it still possible to format disks as MFS?

Answer: Yes. The default format for a single-sided disk was MFS. Although by holding down the Option key when selecting the Erase option you could create a 400k HFS volume. In systems prior to System 7, when viewing the window of a volume in Icon view, an HFS volume would have one black pixel at the far left-hand side of the double horizontal lines that appear below the title bar.

4) Question: How did the introduction of System 7 affect the ability to read and write to MFS disks?

With the introduction of System 7, the ability to read and write files to MFS volumes was retained to maintain compatibility. However, there are some limitations:

* You can still create an MFS volume on a single-sided disk by holding down the Option key (and keeping it held down until the formatting is complete) when selecting Erase Disk under some versions of System 7, including System 7.0x and System 7.1. However, you cannot create an MFS disk under System 7.5.

* With the PC Exchange control panel or ProDOS extension installed, you cannot format disks as single-sided disks. Although you can still write to and read from single-sided disks, both MFS and HFS. So, you must disable this control panel and/or extension if you want to format 400k disks.

* Folders that you see on MFS disks under pre-System 7 systems are no longer visible because the Finder in System 7.x ignores folders created by older versions of the Finder on an MFS disk. A file in such a folder appears in the root level of the disk, but has the same relative position in the window that it has in the MFS folder.

* All the files appear at the root level.

* You cannot rename existing MFS volumes.

* You cannot create new folders on these volumes.

* The Finder does not use or save window position or size information about files located on an MFS disk.

* If you select the single-sided option when formatting a disk, it will be formatted as an MFS volume.

* MFS disks cannot have comments. However, files located within MFS disks can have comments.

* You cannot create an alias for an MFS volume. More generally, Alias Manager functions and the FSMakeFSSpec function do not work if their target is an MFS volume. You can, however, create aliases for files on an MFS volume. Similarly, you can use the new File Manager functions that use FSSpec records on files on an MFS volume.

* You should not call the File Manager function PBGetFCBInfo on MFS volumes.

* The Process Manager's GetProcessInformation function may not return correct results about the location of the application file if the application file resides on an MFS volume.

*If you rename an edition located on an MFS volume, the Edition Manager may not be able to find that edition for any document that publishes to or subscribes to it. Also, if you open an edition in the Finder that is located on an MFS volume and updates the edition, the Finder window closes.

Note: Many of these limitations listed here are documented in Inside Macintosh VI, chapter 25, page 25-9:

System 7: Opening Documents by Dragging them Over an Application

Article Change History

08/25/92 - CORRECTED
* To show the correct documentation reference.

What rules does System 7 use to decide whether I can drop a document on an application icon to have the application open it?

The System frequently doesn't highlight the icon I'm trying to drop the document onto. This is a potentially useful feature. I don't think I've ever done it with an alias of an application.

This article has been archived and is no longer updated by Apple.
The application determines what documents to open when they are dropped on the application icon. There is an FREF resource which now has two main functions for an application:

- Associates the icons defined with file types used by that application.

- Allows you to drag document icons to an application icon to open the documents from that application.

An application should create an FREF resource for the application file itself, and create separate FREF resources for each file type that the application can open. Each FREF resource specifies a file type. The file type can be defined for:

- Files created by that application only

- Files created by other applications that the application supports

- Files of the existing general types, such as TEXT or PICT

When you drag a document icon to an application icon, the Finder checks a list of that application's FREF resources. If the document's file type appears in the FREF resource list, the Finder launches that application with a request to open that document. It's up to the application to open the files according to the needs of the user.

An alias should act the same way as the original it was created from, as the file type will be the same. If you're having problems launching a document alias created by the application you're dragging the alias to, rebuild the Desktop.

There is further information in Chapter 9 (Finder Interface) of Inside Macintosh VI.

PowerBook: External ADB Devices and Wake Up Function

Can an external ADB device be used to wake up a Macintosh PowerBook computer from the Sleep mode?

This article has been archived and is no longer updated by Apple.

No. ADB devices draw a significant amount of power and would drain the Macintosh PowerBook battery. They are disabled when in sleep mode as a power-saving feature.

Published Date: Feb 18, 2012

PowerBook: How To Print From External Modem Port

I have been trying to print directly from my PowerBook 160's modem port to a StyleWriter and an ImageWriter II. Sometimes I get the message that the job is printing, but the job does not print. Other times, I get error messages. I do not have this problem with the printer port.
This article has been archived and is no longer updated by Apple.
This information only pertains to PowerBook models that have two serial ports rather than a single serial port. PowerBook models that have two serial ports include most of the PowerBook 100 series computers (140, 145, 145b, 170, 160, 165, 165c, 180 and 180c).

For information detailing serial printing from PowerBooks that have a single serial port search for the article titled "PowerBook: Printing to Serial Printer-Single Serial Port."

TO USE THE EXTERNAL MODEM PORT TO PRINT TO A SERIAL PRINTER

PowerBook With No Internal Modem

- Select the desired printer driver in the Chooser (such as the StyleWriter II) on the left side of the window.
- On the right side of the Chooser window where it says, "Select a port," select the modem port instead of the printer port.

Even though you will have one of the control panels described below in your Control Panels folder you will not see the choices described (internal/external, compatible/normal, use Express Modem/use External Modem) in your control panel because your PowerBook has no internal modem and external modem to choose between.

PowerBook With Internal Modem

- Change the default setting in the one of the following control panels: Portable, PowerBook, PowerBook Setup, or Express Modem. The specific control panels and settings that need to be changed are listed below under each specific software version.
- Select the desired printer driver in the Chooser (such as the StyleWriter II) on the left side of the window.
- On the right side of the Chooser window where it says, "Select a port," select the modem port instead of the printer port.

System 7.0.1

- Change the default setting in the Portable control panel from Internal Modem to External Modem.
- Use the StyleWriter driver version 7.2.2 to correct a problem with the Portable control panel that occurred when selecting the Internal/External Modem setting.

System 7.1

- Change the default setting in the PowerBook control panel from Internal Modem to External Modem.

System 7.1 w/System Update 3.0, 7.1.1 or 7.5

- Change the default setting in the PowerBook Setup control panel from Compatible to Normal.
- Normal versus Compatible
  In the Normal mode, the modem is addressed via the System 7 Communication Toolbox, and the external port is available for usage.

  If your communication program is NOT compatible with the Communication Toolbox, set the PowerBook Setup control panel to Compatible. This mode prevents the external serial port from being addressed by other programs, as well as preventing communication with a serial printer.

Express Modem Software v1.5 or Later Installed

- Change the default setting in the Express Modem control panel from Express Modem to External Modem.

Apple Telecom 2.0

In the Express Modem control panel, remove the "x" in the box for the selection "use internal modem instead of external Modem Port".

QuickDraw-Based Printers: Not Compatible With DOS or Windows-based PC

How can I connect a Personal LaserWriter LS to an IBM-compatible PC?
This article has been archived and is no longer updated by Apple.
The QuickDraw printer language protocol is not supported under the DOS or Windows operating systems. The following printers use the QuickDraw printer language to reproduce images and text, and therefore are not compatible with DOS/Windows-based computers.

LaserWriter II SC
LaserWriter Select 300

Personal LaserWriter LS
Personal LaserWriter SC
Personal LaserWriter 300

StyleWriter I, II
StyleWriter 1200, 1500, 2200, 2400, 2500, 4100, 4500

Color StyleWriter Pro

IBM-to-LaserWriter connectivity requires a PostScript-based printer, like the Personal LaserWriter NT, LaserWriter IINT/IINTX, and LaserWriter IIf/IIg printers.

Note: The StyleWriter 6500 printer does allow printing via parallel connection from the Windows operating system. However, the printer does not support concurrent QuickDraw/PCL sessions. For printing to the StyleWriter 6500 under Windows from the Apple PC Compatibility card, use the Epson LQ compatible driver.

PowerBook Series: Carrying Case Manufacturers

Do you know of any companies that manufacture carrying cases for the Macintosh PowerBook computers?
This article has been archived and is no longer updated by Apple.
Several companies manufacture carrying cases for the Macintosh PowerBook computers. They include ComputerAid Inc., I/O Design, Inc., Isis International, Inc., Kensington Microware, Ltd., Madson Line, Magenta Seven, Inc., and TCC.

To locate a vendor's address and phone numbers, use the vendor name as a search string.
Published Date: Feb 18, 2012

Macintosh: System 7 and More than 8MB of RAM

My Macintosh Quadra 700 with 20MB of RAM, has only 7MB available. The system software takes up 13MB of RAM.

This article has been archived and is no longer updated by Apple.
If you have more than 8MB of RAM installed in a Macintosh, you can access only 8MB of that RAM unless you have 32-bit addressing turned on in System 7 or you're using A/UX. With 32-bit addressing turned on, you can access up to 128MB of physical RAM. under System 7.

To turn 32-bit addressing on, turn 32-Bit Addressing on in the Memory control panel and restart.

If you're running System 7 in 24-bit addressing mode, or any version of system software before 7.0, any RAM beyond 8MB is treated as if it is already being used by the System heap, and is unavailable for your use.

In your case, a Macintosh Quadra 700 has 20MB of RAM, 12MB of which is automatically allocated to the System heap and is unused. If the System is reported as using 13MB, then the System is actually occupying 1MB of the available 8MB of RAM.

AppleColor Composite Monitors: Compatible With Both IIGS and IIe

There are two AppleColor Composite Monitors shown on the Apple II Products price sheets:

- AppleColor Composite Monitor (IIGS) (part number A2M6020)
- AppleColor Composite Monitor IIe (part number A2M6021)

What are the differences? Are both compatible with both the Apple IIGS and the Apple IIe?

This article has been archived and is no longer updated by Apple.
Both composite monitors work with either computer. The main difference is in the outside designs to better match the case of the computer with which the particular monitor is associated.

ImageWriter II: Condensed Print Problem is Driver Related

I have an ImageWriter II connected to my Macintosh. It's printing condensed mode for no apparent reason.

This article has been archived and is no longer updated by Apple.
The condensed printing problem is printer driver related. The Macintosh prints everything in graphics when Best or Faster mode is selected. Check the Page Setup in the File menu first. If it still prints in the condensed mode, replace the printer driver.

System 7: Video Memory Allocation

Article Change History

08/25/92 - REVISED
* To make clear that holding down the option key still has a role in the System 7 Monitors control panel.

I recently upgraded my Macintosh IIci to system software version 7.0. Under version 6.0.X, when I wanted to change the memory allocation for the built-in video, I used this procedure:

1) In the Control Panel, I selected the Monitors cdev.

2) I pressed the Option key and clicked the "Options..." button.

A dialog box appeared, and in the bottom portion of the dialog box, labeled "Memory Allocation For Built-In Video", there were radio buttons for setting how much memory to allocate to video.

Is this still the correct method for System 7?

This article has been archived and is no longer updated by Apple.
Under system software version 7.0, you no longer need to press the Option key. Just click the "Option..." button in the Monitors control panel to display the dialog box.

If you do hold down the Option key when clicking the "Option..." button in the Monitors control panel, you are presented with an option to "Use Special Gamma" for applications where accurate color representations are essential, or in situations where two differernt types of monitors are used whose colors must match.

Personal LaserWriter LS: Performance Varies with Computer Speed

Article Change History

04/13/93 - UPDATED
* To give clearer examples

Printing time is slower when I print from a Macintosh Plus to a Personal LaserWriter LS than it is when I print from a Macintosh Classic II or Macintosh IIci to the same Personal LaserWriter LS.

This article has been archived and is no longer updated by Apple.
Because the speed of the Macintosh computer's CPU affects the printing time, printing from a Macintosh Plus to the Personal LaserWriter LS is slower than from a higher-speed computer, like the Macintosh Classic II or Macintosh IIci.

The Personal LaserWriter LS has a high-speed RS-422 serial interface, externally clocked at 909KB/sec. At optimum performance, it prints four pages per minute.

Macintosh II and IIx: 16MB SIMMS, MODE32, and RAM (9/95)

According to the "Macintosh Memory Guide" from Connectix, Page 17, second paragraph:

"3) On standard Macintosh II computers Bank A cannot use SIMMs larger than 2MB. 4, 8, and 16MB SIMMs must only be put in Bank B. Also, Bank A must be filled with SIMMs of 2MB or less if Bank B is to be used. Bank A is the set of four sockets to the right as you face the front of the Macintosh. This is a problem unique to the Macintosh II, and is caused by problems in the Macintosh II ROMs which are not overcome by adding MODE32 or MAXIMA. However, you can fix this one problem by installing the FDHD Apple SuperDrive Upgrade kit, which includes a set of Macintosh IIx ROMs. As a result of this limitation, the largest memory configuration on unmodified Macintosh II computers using 1MB and 4MB SIMMs is 20MB: four 1MB SIMMs in Bank A and four 4MB SIMMs in Bank B. When Macintosh IIx ROMs are added the maximum memory the computer will support is 128MB, eight 16MB SIMMs."

Is this information accurate? I was under the impression that the Macintosh II and Macintosh IIx could physically support only 4MB SIMMs.

This article has been archived and is no longer updated by Apple.
Below is an excerpt from another article describing MODE32. The excerpt describes Macintosh II RAM issues. To see the full article, search under MODE32.

"The Macintosh II and Macintosh IIx require special 4MB SIMMs. Be sure
to specify your Macintosh model when ordering these SIMMs and ensure
that the vendor is aware of the difference. The Macintosh II requires
the Macintosh II FDHD Upgrade to use 4MB SIMMs.

This upgrade has been discontinued.

To take advantage of more than 8MB of physical RAM, the Macintosh II
MUST have a PMMU installed, so that MODE32 can expand the system's
memory map.

The Macintosh II will not start up if you install 4MB SIMMs in bank A.
You'll hear musical chimes at startup, indicating a hardware failure.
Install 4MB SIMMs in bank B, and use 256K or 1MB SIMMs in bank A."

If you read the part about the Macintosh II carefully, you will see that it cannot have greater than 1MB SIMMs in Bank A, or you will get musical chimes. Since this happens so early in the boot process, there is nothing that can be done in software to remedy this. This means that a Macintosh II can have a maximum of 68MB of RAM installed (using a PMMU and MODE32). To achieve this amount, you would have 4MB in Bank A, and 64MB in Bank B (using 16MB SIMMs).

A final, but very important issue here concerns the part discussing the special SIMMs required by the Macintosh II and Macintosh IIx. There is nothing to say that vendors will actually make 16MB SIMMs using this configuration.

Article Change History:
15 Sep 1995 - Revised to show discontinued upgrade.
02 Apr 1995 - Updated for clarity.
02 Mar 1994 - Emphasized the need for a PMMU to utilize more memory.

PowerBook: How to Eliminate Clicking Noise (5/95)

I hear random clicks from my PowerBook 170. Adjusting the volume to zero doesn't eliminate the problem.

This article has been archived and is no longer updated by Apple.
The click is the power manager shutting down the amplifier to extend battery life. It happens approximately thirty minutes after the last sound is played. It's not a bug, but it can be annoying.

For the PowerBook 100, 140, 145, and 170, you can disable the speaker by inserting a mini plug in the sound out port. When you want sound, unplug it. This way you can eliminate sound and turn on the system in a meeting without disturbing others.

For newer PowerBook computers (the 160 and newer, as well as the Duo series), if you want to shut off sound entirely, set the volume in the Sound control panel to zero and the PowerBook will not make any sound, at startup or any other time.

LaserWriter: PageMaker 4.2 Uses PPD, Not APD Files (8/95)

There's a problem printing Aldus PageMaker 4.0 documents to a LaserWriter. Any suggestions?

This article has been archived and is no longer updated by Apple.
To print publications, Aldus PageMaker 4.2 uses PostScript Printer Description files (PPD files) in much the same way as earlier versions of PageMaker used Aldus Printer Description (APD files). PageMaker 4.2 doesn't use APD files. Therefore, when you open a PageMaker 4.0 or 4.0.1 publication in PageMaker 4.2, you must choose Print ╔ to specify a new printer (by selecting a PPD). When you first choose Print ╔ you will receive an error message indicating that PageMaker failed to find a PPD. The message is misleading:

* First, the PPD it refers to corresponds to the APD you last specified in
the 4.0 or 4.0.1 publication
and
* Second, it implies that it searched and didn't find the PPD in the PPDs
folder when this is not actually the case.

Simply click Continue, to open the Print dialog box. Choose the PPD you want from the Printer type pop-up menu.

It's a good idea to save the publication after selecting the PPD, otherwise you'll get the message each time you print.

NOTE: When you open a PageMaker 4.2 publication in PageMaker 4.0 or 4.0.1, you must open the Print dialog box and select an APD.

The following is a list of PPD files shipped with PageMaker 4.2 for Apple printers:

Apple LaserWriter IIf v2010.113
Apple LaserWriter IIg v2010.113
Apple LaserWriter v23.0
Apple LaserWriter Plus v38.0
Apple LaserWriter Plus v42.2
Apple LaserWriter IINTX v47.0
Apple LaserWriter IINTX v51.8
Apple LaserWriter IINT v47.0
LaserWriter Personal NT v51.8

The following is a list of PostScript versions from the Tech Info Library article, "Postscript: Versions in LaserWriter ROMs."

Revision #
Displayed on ROM PostScript
Printer Test Print Size Version
_____
LaserWriter 1.0 256K 23.0
LaserWriter 2.0 512K 38.0
LaserWriter Plus 2.0 512K 38.0
LaserWriter Plus 3.0 512K 47.0
LaserWriter IINT 1.0 1MB 47.0
LaserWriter IINTX 1.0 1MB 47.0
LaserWriter IINTX 3.0 1MB 51.8
Personal LaserWriter NT 1.0 1MB 51.8
LaserWriter IIf 1.0 2MB 2010.113
LaserWriter IIg 1.0 2MB 2010.113
Personal LaserWriter NTR 1.0 2MB 2010.129

The LaserWriter Plus with revision 3.0 ROMs reports back that it has PostScript version 42.2. This is an error in revision 3.0 ROMs. PostScript version 47.0 is the actual version in the revision 3.0 ROMs.

The LaserWriter IIf, LaserWriter IIg, and Personal LaserWriter NTR have PostScript Level 2 in ROM. All other LaserWriter printers have PostScript Level 1 in ROM.

LaserWriter: Apple IIe Card Only Prints 11-inch Page

Article Change History

11/04/92 - REVIEWED
* For technical accuracy.

I have a LaserWriter connected to a Macintosh LC with an Apple IIe Card. The LaserWriter uses the multipurpose tray. I configure the IIe Card software to use the Printer Port (slot 1) to print to the LaserWriter.

When printing a legal-size document in AppleWorks 3.0, I run into printing anomalies. If I specify a 14-inch page in AppleWorks and print the document on an ImageWriter II, the document prints on one page. If I print to the LaserWriter with legal-size paper in the tray, it prints 11 inches only and finishes the document (2 more lines) on the second page. The margin settings are .5-inch left and right, and 0 top and bottom.

This article has been archived and is no longer updated by Apple.
We've confirmed this anomaly and anticipate it will be corrected in a future release of the software.

At this point we can suggest no workaround.

System 7 LaserWriter Driver: How to Shrink PostScript Files

With System 6, I could use Command-K to dump a PostScript image with Laser Prep, or Command-F to dump a PostScript file without Laser Prep.

With System 7, I can't seem to find a way to dump the PostScript file without the Laser Prep. Now an option in the print dialog allows me to select "Postscript File." This provides the same function as Command-K. But is there a way I can exclude Laser Prep as I did with Command-F?

Also, is there any way to make the generated PostScript file any smaller than it is?
This article has been archived and is no longer updated by Apple.
There is no Apple solution yet for generating PostScript files without headers under System 7. The latest improvement is the version 7.1 LaserWriter driver, which improves printing performance. But we don't have a solution to the problem of extremely large saved files.

The large saved file situation is caused by two major changes from the driver versions prior to 7.0 (excluding 6.1, which is really an old version of 7.0.):

- The addition of TrueType, and

- The need to prevent "laser wars."

TrueType fonts require the TrueType scaler on the destination printer. Because the driver doesn't know anything about the final destination when saving to a file, it saves everything that might be necessary. This can add several hundred kilobytes to the file's size, and that's with only a couple of fonts. The scaler itself adds well over 100K.

Laser war problems at customer sites with several different driver versions motivated a change in the prep dictionary downloading. Prior to System 7, the first user to print downloaded their version of Laser Prep semi-
permanently (outside of the server loop; remaining until a power cycle). Subsequent print jobs from other users would query the LaserWriter and see that the prep information already existed. If the query found an incompatible version, their prep dictionary replaced the existing one. If the existing version was compatible, everything worked fine. The prep dictionary is referenced from the LaserWriter driver's output as a library of procedures. If the referenced routines don't exist the print job will fail.

The System 7 method sends the prep information along with each print job. Since it isn't downloaded semi-permanently, it's always saved with a file because the information is still required. In addition to increasing the file size, this conflicts with non-Apple laser printers (usually connected to workstations or minis) that use substitute prep dictionaries. Since the prep dictionary isn't always present in the LaserWriter, the Command-F option wouldn't work anyway without adding the header code.

A shareware program called Trimmer allows you to select fonts you want excluded from saved files. It also allows the exclusion of the TrueType scaler. Trimmer also provides an option of excluding the Laser Prep header from the PostScript file, simulating the Command-F option from System 6.x. It provides a good way to eliminate unneeded data from saved files. But it's an unsupported non-Apple solution.

LaserWriters: Changing EtherTalk Default Zone

Does the utility software that comes with the LaserWriter IIg (which connects directly to Ethernet) allow the user to change the zone that the printer resides in?

Also with the LaserWriter Pro 630, Pro 810, and 16/600 PS is there a utility that can be used to change the zone?
This article has been archived and is no longer updated by Apple.
There are two utilities that will enable you to change the zones the printers are located in. Use the "Apple Print Utility" for the LaserWriter 16/600 PS, and place the printer's configuration switch in the up position for the zone change to be persistent between restarts. For the LaserWriter IIg, Pro 630 and Pro 810, use "LaserWriter Utility" v7.4.1 or later.

If you don't have LaserWriter Utility v7.4.1 or later, the utility included with the LaserWriter IIg doesn't have an option to select a zone when connected to an EtherTalk network that has more than one zone associated with it. You can change the zone that the LaserWriter IIg appears in with this PostScript code:

```
---Cut Here---
currentfile statusdict begin product (LaserWriter IIg) eq
version (2010.113) eq and end not
{save exch 291 string readstring pop pop restore} if
/ASCIIHexDecode filter /SystemPatch statusdict /emulate get exec
85f6ba98b8147bdb3c41fc154e390200521caba043febd65f48e008d42590001cd0f62e
4c9f2b841c6c1c85660f30002ba262234d72494f203c119951000000376b481858e01bff2
db172cf2ecfe000446e2f3ddca7b1fb2d27814e1c22e000598f64cae7bb9897afb760a5d8
1ac0106>
serverdict begin 0 exitserver
(%EtherTalk%) <</EtherTalkZone (YourZoneGoesHere)>> setdevparams
---Cut Here---
```

1) Copy all information between the "---Cut Here---" lines.

2) Paste the information into a text document.

3) Change the text "YourZoneGoesHere" in the last line to the new zone name.

4) Save the text document as a file.

5) Download the file with the LaserWriter Utility.

After sending this code, the LaserWriter IIg should appear in the new zone. If the zone name requested isn't valid for the EtherTalk network, the LaserWriter IIg uses "*" as the zone name and appears in the default zone. A valid zone name is a string of up to 32 characters, excluding the ":" and "@" characters.

Notes

For a LaserWriter to be in a particular zone:

1) The LaserWriter must be directly connected to an EtherTalk Phase 2 network via the built-in Ethernet port.

2) The zone in which the LaserWriter is to appear must be in the zone list for the physical cable (network) to which the LaserWriter is attached -- which, in this case, must be Ethernet. This is defined by the router for the physical cable.

Tip for Sending PostScript Code to a LaserWriter

An easy way to send PostScript code to a LaserWriter is to enter it into a TeachText or SimpleText document and download it using the LaserWriter Utility's Download PostScript File option. TeachText or SimpleText is included with Macintosh system software, and the LaserWriter Utility is included with the LaserWriter.

TA47974_AppleTalk_Using_Multiple_Versions_on_Same_Network_(TIL09538).pdf

AppleTalk: Using Multiple Versions on Same Network

How many versions of AppleTalk can we run on a 20-Macintosh network? We currently have version 56 on most of the computers.

This article has been archived and is no longer updated by Apple.
There should be no incompatibilities between various versions of AppleTalk.
It's important to know that AppleTalk phase 2 was introduced with AppleTalk version 53.

AppleTalk version 56 introduced many bug fixes and should be the minimum version in use on any network with highly utilized servers or routers.
Most of the bug fixes included in version 56 were related to crashes and other problems with nodes operating in a high stress environment.

Published Date: Feb 18, 2012

Ethernet Transceivers: Require Hub Termination

We have problems selecting EtherTalk with the NB card, LC card, or built-in Quadra cards. The usual message is "An error occurred while trying to install the selected AppleTalk connections. The built-in LocalTalk port will be used instead."

We know that we have to plug in the transceiver before starting the Macintosh. Do twisted pair transceivers also require hub termination?

This article has been archived and is no longer updated by Apple.
The Ethernet NB card driver performs three loopback tests before enabling user services. If any one of these tests fail, the card won't allow you to use the attached network. The initial two tests check the card's internal communications paths. However, the third test performs a loopback test using external parts of the network. If any part of the external network fails to function properly (this includes 10baseT links), the test fails and your port switches to the built-in LocalTalk port.

Concerning 10baseT hub termination, you definitely need to have hub termination before the driver allows you to select user services.

System 7.0.1: Installing the Ethernet Driver

Article Change History

09/25/92 - REVIEWED
* For technical accuracy.

We've had problems installing system software version 7.0.1 with a NEW Apple Ethernet board installed in the Macintosh. Here's what happens:

1) Upon clicking the installer, we don't get the list of EtherTalk drivers, and we have to choose customize.

2) After completing the installation, the system doesn't work with the new board. We then use the disk that comes with the Ethernet board to install the drivers and A/ROSE.

3) The driver from this disk doesn't work with version 7.0.1, so we must again use the 7.0.1 disk to install the correct Ethernet driver.

Can you suggest a better way to do this?

This article has been archived and is no longer updated by Apple.
To get the Ethernet NB card installed and working:

1) Install system software version 7.0.1.

Note: You must have the Macintosh connected to a working network before the driver lets the user services become active.

2) Then use the disk that ships with the Ethernet NB card (version 2.5.1) to install the Ethernet driver.

3) Restart the Macintosh.

AppleShare 3.0: Using a Users & Groups File on Multiple Servers

I'm setting up several AppleShare 3.0 servers, and I'm having problems copying the Users & Groups File. I have an existing AppleShare 3.0 server up and running with over 100 users and groups in the database. This server is a Macintosh SE/30.

I'd like to use the Users & Groups file on a Macintosh IIci from the Macintosh SE/30 server. I can copy the file without problems. When I open up AppleShare Admin, it shows me the first server's name and asks me for the admin key. After I type the correct admin key, I get a list all of the users and groups. If I quit the Admin application and reopen it, I get the
message, "The Users and Groups file is damaged."

How can I successfully copy the file?
This article has been archived and is no longer updated by Apple.
Following are the procedures to use the same Users & Groups file for multiple servers:

1) Install and configure an AppleShare 3.0 server with a complete Users & Groups list.

2) Copy the saved Users and Groups file to a spare floppy disk.

3) Open the Preferences folder, located in the System Folder of the next system to have the server software installed. Drag the Users & Groups file to the Trash. **Note:** It won't let you delete the file from the Trash, but that's OK.

4) Copy the saved Users & Groups file from the floppy disk to the Preferences folder.

5) Insert the AppleShare 3.0 server disk and double click the installer icon to start the installation.

6) After server installation, you must restart the Macintosh.

7) Start the Admin program to automatically read in and use the saved Users & Groups file. In a short time you'll see the complete Users and Groups lists appear, and you can then proceed with any other specific server administration that you need to do.

You can quit the admin program and relaunch it with no problem. Once you're satisfied with the configuration, you can start the server by double clicking on the server application.

Macintosh System Software: Correct Responder Versions

I support 2,500 Macintosh computers, and I'm using Inter*Poll to monitor the various systems. I can only access printer driver information on some of the computers.

It seems that only Responder version 2.0.2 works with system software version 6.0.7, and that only Responder 2.0 works with system software version 7.0.

I'm not sure where the various versions of Responder extensions are coming from on the System 7 computers. The Responder is built into the system, and I followed the same installation on all of the computers.
This article has been archived and is no longer updated by Apple.
Responder version 1.1.1 doesn't report any information for printer drivers if the 7.0 drivers have been installed on a System 6 Macintosh. Responder versions 2.0.2, 2.0.3, and 2.0.4 are the correct versions to use with this configuration (System 6 using 7.0 drivers), and will report back the correct printer driver information to Inter*Poll.

Before any Macintosh will report the printer driver information, you must first select a printer (driver) from the Chooser. You don't actually have to select a printer, just a printer type (that is, LaserWriter, ImageWriter, and so on), and then restart the Macintosh.

Another anomaly is that the 2.0.1 Responder is built in to System 7 and must be removed before any of the stand-alone versions (2.0.2, 2.0.3, and 2.0.4) will load and function. There's no real reason to remove the built- in Responder; this information is for education and possibly future testing purposes only. None of the current N&C installers will remove the 2.0.1 Responder resource from the System file. You must remove it manually before any of the stand-alone versions of Responder will load on a System 7 computer.

A good indication that the 2.0.1 Responder is installed as well as a stand- alone version is that the Responder icon will be X'ed out when the INITs (extensions) display their icons at startup time. The built-in Responder in System 7 is located in the AINI resource in the System file, resource number is 32000.

Here's a matrix that describes where each version of Responder comes from. This should help sort out why so many different versions are showing up on the BNR Internet and help you to get the correct versions installed on the systems.

Product	Responder Version
6.x	1.1.1 (This includes 6.0.8)
7.0	2.0.1 Built in to the System (Inter*poll reports it as 2.0)
7.0.1	2.0.1 (same notes as 7.0)
7.1	2.0.3 (same notes as 7.0)
Ethernet NB 2.5.1	2.0.2
ARA 1.0	2.0.3
NSI 1.0	2.0.3
NSI 1.1	2.0.3
NSI 1.2	2.0.3
NSI 1.2.1	2.0.3
NSI 1.3	2.0.4
NSI 1.4	2.0.4

InterPoll: System 7.0.1 and Printer Drivers

After I installed System 7.0.1 on a networked Macintosh, Inter*Poll 1.0.1 is unable to see or identify the LaserWriter driver on the 7.0.1 system. Is there a workaround for this?

To test:

1) Install 7.0.1 on a Macintosh on the network.
2) Start Inter*Poll on another Macintosh.
3) Choose System Information under the Special menu.
4) Click on the LaserWriter Driver Version radio button.

The 7.0.1 system won't show a LaserWriter Driver installed.

This article has been archived and is no longer updated by Apple.
This isn't a problem. System 7.0.1 reports back the correct printer driver information without any modification or update to any system resources. Please read the information below.

Responder Information

Version 1.1.1 of Responder doesn't report back any information for printer drivers if the 7.0 drivers have been installed on a 6.x system. Responder versions 2.0.2 and 2.0.3 are the correct versions to use and will report back the correct printer driver information to Inter*Poll when installed on a system 6.x Macintosh that is using the 7.0 print drivers. Before any Macintosh will report the printer driver information, you must first select a printer (driver) from the Chooser. (You don't actually have to select a printer just a printer type, such as LaserWriter, ImageWriter, and so on.) Then restart the Macintosh.

Another anomaly is that the 2.0.1 Responder is built into System 7 and must be removed before any of the stand-alone versions (2.0.2, 2.0.3) will load and function. None of the current N&C installers will remove the 2.0.1 Responder resource from the system. You must remove it manually before any of the stand-alone versions of Responder will load on a System 7 Macintosh. A good indication that the 2.0.1 Responder is installed as well as a stand-alone version is that the responder icon will be X'ed out when the INITs (extensions) are displaying their icons at startup time. The built-in responder in System 7 is located in the AINI resource. The resource number is 32000, size 4104.

Here is a matrix that describes where each version of Responder comes from. This should help to sort out why so many different versions are showing up on the BNR internet and help to get the correct versions installed on the correct systems.

Product Responder Version

6.x | 1.1.1 (This includes 6.0.8)

7.0 | 2.0.1 Built in to the System (Inter*Poll reports it as 2.0)

7.0.1 | 2.0.1 (same notes as 7.0)

Ethernet NB
2.5.1 | 2.0.2

ARAP 1.0 | 2.0.3

PowerBook Fax/Data Modem: Doesn‘t Pass Break Signal

If you attempt to send a break signal to a remote host with the Macintosh PowerBook Fax/Data Modem, it won't pass the break signal to the host. Instead, it causes the modem to go back to command state.

How do you pass a break signal to the host without putting the modem into its command state?
This article has been archived and is no longer updated by Apple.
Unfortunately, any attempt to transmit a break signal with the Macintosh PowerBook Fax/Data Modem always results in the modem going into command state. It won't send the break signal to the host.

Many modems allow you to change break handling so you can determine whether the modem enters command state or simply passes the break signal. The PowerBook Fax/Data Modem doesn't do this.

PowerBook: Modem Connections After Using Fax

After I send a fax with Apple's fax software v1.0.1, I'm unable to connect with on-line services like America Online with White Knight v11.12. In White Knight, I dial the number, the modems handshake, the dialing window clears, then I get a no connection message. Then I have to type a return several times to get any activity. When connecting via an external modem with the same software, I do not have this issue.
This article has been archived and is no longer updated by Apple.
After sending a fax, the PowerBook modem is left with the Connection Mode set to "error control mode" (the modem's factory default, "&Q5"). This instructs the modem to make a connection using V.42/MNP. If the remote modem doesn't offer V.42/MNP, the modem falls back to standard asynchronous mode. During the fallback process, some remote modems, depending on how they're configured, may disconnect.

You can eliminate this problem by setting the PowerBook modem's connection mode to asynchronous mode, with no error correction protocol, via "AT" commands. From White Knight, MacTerminal, or any other terminal emulation program, simply enter AT&Q0 (zero, not the letter "O"), and press return.

From America Online, under the Go To menu, choose Customize Network Setup. In the Modem String field, enter &Q0. America Online will automatically insert the Modem String between the modem attention AT command and the dialing sequence. For example, assume you've configured America Online for tone dialing, you've entered the phone number 555-1212, and you've entered &Q0 as the modem string. The software would use the full dialing sequence AT&Q0DT555-1212.

PowerBook 170: Specifications (Discontinued)

This article gives technical specifications for the Macintosh PowerBook 170 notebook computer.

This article has been archived and is no longer updated by Apple.

Microprocessor

- 68030, running at 25 MHz
- 68882 math coprocessor, running at 25 MHz

Memory

- Comes with 4MB pseudostatic RAM, 2MB on the logic board and 2MB on a RAM expansion card that fits into a card slot.

- Expand to 8MB of RAM by replacing the 2MB expansion card with either a 4MB or 6MB RAM expansion card.

Disk Storage

- One built-in 1.4MB drive that uses high-density floppy disks; it reads, writes, and formats Macintosh, MS-DOS, OS/2, and ProDOS disks.

- One internal 40MB hard disk

Display

- 10 inch (254 mm) diagonal

- Backlit active-matrix liquid crystal display

- 640 by 400 pixels

Battery

- NiCad, 2.5 ampere-hours, provides 2 to 3 hours of use before recharging is necessary

- Recharge time: 100% recharged after 5 hours; 80% recharged after 3 hours

Keyboard

- Built-in keyboard with standard Macintosh layout

- Two-level tilt adjustment

Trackball

- dual button trackball, 30 mm diameter

Clock/Calendar

- CMOS custom chip with long-life lithium battery

Interfaces

- One Apple Desktop Bus (ADB) port for keyboard, mouse, and other devices using a low-speed, synchronous serial bus

- Two RS-422 serial ports for LocalTalk networking, printers, modems, and other devices

- One HDI-30 SCSI port for hard disks, scanners, CD-ROM drives, and other devices

- One sound output port for external audio amplifier

- One sound-in port

Modem

- Internal 2400-baud modem with fax send at 9600 baud; includes fax send software

- Error correction and compression: MNP 4,5 and V.42, V.42bis

Sound Generator

- Apple Sound Chip provides 8-bit sound capable of driving stereo headphones or other stereo equipment through the sound port.

Sound Input

- 8-bit sound, sampled at 11 or 22 kHz

Disability Access

- CloseView, Easy Access, and visible beep included with system software. These built-in solutions and third-party options provide alternative input and output devices for people with disability.

ADB Power Requirements

- Maximum current draw for all ADB devices is 50 milliamps (a maximum of three ADB devices is recommended)

Electrical Requirements

- Line voltage: 110 to 220 volts

- Frequency: 50 to 60 Hz

Environmental Requirements

- Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)

- Storage temperature: -40 to +149 degrees F (-40 to +65 degrees C)

- Relative humidity: 20% to 80% noncondensing

- Altitude: Operating: 3048 m (10,000 ft.) maximum
Shipping (non-operating) 0 to 15,000 ft. (0 to 4,722 m)

Size and Weight

- Height: 2.25 inches (5.7 cm)
- Width: 11.25 inches (28.6 cm)
- Depth: 9.3 inches (23.6 cm)
- Weight: 6.8 lb. (3.08 kg)

Noise Level

Noise free except for floppy or hard disk use.

Article Change History:

22 Mar 1995 - Updated altitude information.
27 Aug 1993 - Revised to reflect correct storage temperatures.

PowerBook: Fax/Data Modems

I read that the Macintosh PowerBook Fax/Data Modem is only a SEND modem. Is it possible that clients can use it as a SEND/RECEIVE (Fax) modem? Can they use some third-party Fax software, such as Abaton, to do a SEND/RECEIVE function?
This article has been archived and is no longer updated by Apple.
The Macintosh PowerBook Fax/Data Modem is limited to Fax send only. It's a hardware -- not software -- limitation.

There are several third-party modems that support both Fax send and Fax receive. Here are some PowerBook Fax/Data Modem suppliers:

- Global Village Communication, Inc.

- PSI Integration, Inc.

- Lifetime Memory Products, Inc.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

AppleTalk Remote Access: Network Install from Hard Disk

Can we install AppleTalk Remote Access from a hard disk and/or over the network instead of from the floppy disk? We've tried but have been largely unsuccessful.

This article has been archived and is no longer updated by Apple.

One 1.44MB Disk

Here's how you create a "Net Install" version of AppleTalk Remote Access from one 1.44MB disk:

1) Create a folder called "ATRA Net Install" on your Macintosh hard drive.

2) Insert the AppleTalk Remote Access Installer disk.

3) Drag the floppy disk icon on top of the "ATRA Net Install" folder icon. This will create a folder called "Installer" within the "ATRA Net Install" folder and a copy of the contents of the floppy to the "Installer" folder.

4) Open the "ATRA Net Install" folder.

5) Open the "Installer" folder.

6) Change the name of the application inside from "Installer" to "Install"

7) Drag the files "Install" and "Remote Access Script" out of the "Installer" folder, to the root level of the "ATRA Net Install" folder.

Two 800K Disks

Here's how you create a "Net Install" version of AppleTalk Remote Access from two 800K disks:

1) Create a folder called "ATRA Net Install" on your Macintosh hard drive.

2) Insert the AppleTalk Remote Access Installer Disk 1.

3) Drag the floppy disk icon on top of the "ATRA Net Install" folder icon. This creates a folder called "Installer Disk 1" within the "ATRA Net Install" folder and a copy of the contents of the floppy to the "Installer Disk 1" folder.

4) Insert the AppleTalk Remote Access Installer Disk 2.

5) Drag the floppy disk icon on top of the "ATRA Net Install" folder icon. This creates a folder called "Installer Disk 2" within the "ATRA Net Install" folder and a copy of the contents of the floppy to the "Installer Disk 2" folder.

6) Open the "ATRA Net Install" folder.

7) Open the "Installer Disk 1" folder.

8) Drag the files "Installer" and "Remote Access Script" out of the "Installer Disk 1" folder, to the root level of the "ATRA Net Install" folder.

AppleTalk Remote Access: Need Phase 2 EtherTalk to Answer Calls

At home, I have a (host) Macintosh IIci with Practical Peripherals 2400 baud modem attached to a LocalTalk network. It's running System 7, with file sharing enabled (one user belonging to one a group called Remote Developers). This user has remote dial-in, connect and link privileges.

At work: I have a (host) Macintosh with a Practical Peripherals 2400 baud modem (modem port) attached to a Phase I Ethernet network using a Technology Works Ethernet (thin) card. It's running System 7 and has a direct Ethernet connection. This network consists of five Ethernets terminating at a cisco router. A number of KBoxes with LocalTalk networks are attached to some Ethernet segments. This Ethernet routes AppleTalk Phase I, IP and IPX packets. This network contains one AppleShare server, one QuickMail Server, and four Novell NetWare file servers.

When the host computer at home is set up to answer the modem, the computer at work can dial in, log on to file servers, and so on. This works fine with and without the call-back features enabled.

But when I attempt to configure the work computer to answer the modem, an error message says: "Sorry, the network connection you have chosen doesn't support AppleTalk Remote Access."
This article has been archived and is no longer updated by Apple.
Technology Works Ethernet Cards (TechWorks NuBus cards) ship with Apple's EtherTalk software, both AppleTalk Phase 1 and Phase 2.

On a Phase 1 EtherTalk network, AppleTalk Remote Access allows you to place calls, but it WON'T allow you to answer calls.

You need to upgrade to Phase 2 EtherTalk to enable the Answer Calls or server option within AppleTalk Remote Access.

Macintosh: Troubleshooting Modem Connect Problems

I installed public domain telecommunications software on my Macintosh to use with my modem. After initiating a connection, the call is answered, but my system locks.

Can you give me some general troubleshooting tips to locate the problem?

This article has been archived and is no longer updated by Apple.
Here are some general troubleshooting tips:

- Ensure that the baud rate is set correctly.

- Ensure that the bit and parity settings are set correctly.

- Ensure that you're using a clean line.

- Try connecting to other services. Does this problem happen only with one service or with several?

- Try using a commercial telecommunications software package. Do you still have the problem?

PowerBook: How To Tell When Caps Lock Function Is Active

Some of the Macintosh PowerBook series keyboards do not appear to have a Caps Lock function. How can this be? Is there any visual indication of when the Caps Lock function is active? What is the Caps Lock extension and do I need it?
This article has been archived and is no longer updated by Apple.

Macintosh Portable

The original Macintosh Portable has a locking Caps Lock key. It clicks and locks into place in the down position when active like the keyboard used with most desktop computers. The Caps Lock extension does not work on the Macintosh Portable.

Macintosh PowerBook Computers

None of the Macintosh PowerBook computers have a locking Caps Lock key. The Caps lock keys on these computers do not make an audible click when you press the Caps Lock key.

- Some PowerBook models have a green LED (light) on the Caps Lock key. If this LED is illuminated, the Caps Lock function is active.
- Some PowerBook models do not have an LED on the Caps Lock key. On these computers, when the Caps Lock function is active, an "up" arrow is displayed in the upper right corner of the Menu Bar next to the Balloon Help icon. If this arrow does not appear in the Menu Bar, the Caps Lock extension is probably not properly installed in the Extensions folder of the System Folder.

Connectix PowerBook Utilities

If you want another indicator in addition to the light on the Caps Lock key itself, you can get a piece of software called Connectix PowerBook Utilities (CPU) which gives an audible clicking sound from the speaker when the Caps Lock key is pressed (it also provides may other features).

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for any content pertaining to non-Apple products. Please contact the vendor (Connectix) for additional information.

The article 17159: **Locating Vendor Information** can help you search for a particular vendor's address and phone number.

LaserWriter IIf/IIg: RAM Configurations

What are the different RAM configurations for the Apple LaserWriter IIf/IIg?
This article has been archived and is no longer updated by Apple.
The Apple LaserWriter IIf/IIg can use 256K, 1MB, and 4MB SIMMs.

The configurations are:

.

RAM	Bank 0	Bank 1
2MB (1)	Four 256K SIMMs	Four 256K SIMMs
4MB (1)	Four 1MB SIMMs	None
5MB	Four 1MB SIMMs	Four 256K SIMMs
8MB	Four 1MB SIMMs	Four 1MB SIMMs
16MB	Four 4MB SIMMs	None
17MB	Four 4MB SIMMs	Four 256K SIMMs
20MB	Four 4MB SIMMs	Four 1MB SIMMs
32MB	Four 4MB SIMMs	Four 4MB SIMMs
Table Notes (1) These configurations are for the Apple LaserWriter IIf only.

LaserWriter: Troubleshooting Print Jobs That Don‘t Print

I am printing from a Macintosh on a network to a LaserWriter with Background Printing turned on. Intermittently, when I send a print job to the printer, it doesn't print. If I reselect the LaserWriter in the Chooser, the job prints.
This article has been archived and is no longer updated by Apple.
Here are some troubleshooting tips to help you locate the problem:

- Check the network for proper termination.
- Check the equipment and network for frayed or damaged wires and cables.
- If other Macintosh computers on the network are not having these printing problems, move your Macintosh to one of these known-good locations and try printing from there. If you still have the same problem, it's likely to be associated with your Macintosh.
- If other Macintosh computers on the network are having the same problem, try to eliminate the network as the source first. Connect the LaserWriter directly to a Macintosh (other than yours) and try printing from there.
- If the problem persists, troubleshoot your LaserWriter.
- If the problem is corrected, troubleshoot your network.
- If you are using a non-LocalTalk LaserWriter, such as the LaserWriter Select 310, make sure AppleTalk is turned off in the chooser. Also make sure that you are using a peripheral-8 cable (M0197LL/B) and not a LocalTalk or PhoneNet connetor.
- When using a serial LaserWriter check the chooser and verify that the proper port is selected.

Macintosh IIsi: Troubleshooting NuBus Card Installation Problems

I am having a problem installing TokenTalk and EtherTalk NB cards on our Macintosh IIsi computers. We have not been able to get any of the systems up on the network.

This article has been archived and is no longer updated by Apple.
Without more detailed information about the problems you are experiencing, we can offer only some troubleshooting measures:

- Ensure that the network is properly terminated.

- If you are running System 6.0.7, ensure that the Network Product Installer is used to installed the Network CDEV and TokenTalk/EtherTalk drivers.

- If you have the Macintosh IIsi NuBus Adapter Card installed and the EtherTalk NB Card is properly installed, ensure that the jumper on the EtherTalk NB Card is set for BNC.

Macintosh: Troubleshooting Non-Functioning Mouse Control Panel

I have a Macintosh Plus running system software version 7.0. I recently upgraded the RAM from 2.5MB to 4MB, and the Mouse control panel stopped functioning -- I no longer can change the tracking speed.

This article has been archived and is no longer updated by Apple.
Increasing the RAM should not affect system software version 7.0. This problem may be related to a third-party system extension (INIT) conflict.

Try removing all third-party system extensions (INITs), control panels (CDEVs), and DAs from your System Folder for testing purposes. Then reinstall the system software. If the problem is corrected, isolate the conflicting software by reinstalling the system extensions, control panels, and DAs one at a time until the problem reappears. Remember to allow an appropriate testing time between each installation.

If the problem persists, try zapping the PRAM by pressing and holding the Option-Command-P-R keys and restart your Macintosh.

Video Monitors: Why Some Screens Have Squared Corners

I'm using a Macintosh SE/30 to which I added an AppleColor High-Resolution RGB Monitor. I noticed something unusual about the monitor's display area: all corners, except the lower left, are rounded. The lower left has a squared (right-angle) corner. Is this a defect?

This article has been archived and is no longer updated by Apple.
This is not a defect nor is it peculiar to the AppleColor High-Resolution RGB Monitor -- we have seen these squared corners on other Apple and third-party monitors. It's just cosmetic and is more likely to happen when multiple monitors are connected to the computer.

Extended 80-Column Text Card: Function of Jumper J1 (11/96)

What is the function of jumper J1 on the Apple IIe Extended 80-Column Text Card?

This article has been archived and is no longer updated by Apple.

Jumper J1 on the Extended 80-Column Text Card enables the use of double high-resolution graphics on the Apple IIe Rev.B main logic board.

Changes to Extended 80-Column Card Instructions

The instruction sheet that comes with the Extended 80-Column card states that a "small plastic jumper" should not be installed on the 80-Column card if the number on the back of any Apple IIe main circuit board ends in an "A".

This is incorrect. The jumper should always be installed on the 80-Column card UNLESS the number on the main circuit board ends in "...0064-A". Other than this instance, every Extended 80-Column Card should have the jumper installed.

PowerBook: Keyboard and Keypad Sequences

How do I send VT-100 keypad sequences to my mainframe application from the Macintosh PowerBook keyboard?
This article has been archived and is no longer updated by Apple.
If you are using the VT-102 tool (part of the Communications Toolbox) and MacTerminal 3.0, you can issue the keypad commands from the Keys menu. If you are using a Communications Toolbox-compliant application, you should be able to issue the commands from the menu the application provides for keypads.

If you are not using a Communications Toolbox-compliant application, you may need an application revision that works with the PowerBook. That is, the PowerBook keyboard has a new identifier* inside the Macintosh Operating System, and some applications may not map the mainframe key sequences from the keyboard.

You can use ResEdit to get the ASCII codes for the keypad, but more than likely, you want the key sequences that the mainframe requires. You could then create macros to issue them, or remap them to different keys if the application supports that.

*In particular, the PowerBook keyboards return selector identification codes of:

gestaltPwrBkADBKbd = 12; {PowerBook Keyboard}
gestaltPwrBkISOKbd = 13; {PowerBook Keyboard (ISO)}

for the Gestalt "kbd" selector. If your application uses Gestalt to determine the keyboard type, it may not check for this result (since it is new with the PowerBook) and may not do the correct mappings for the mainframe key sequences.

LaserWriter IIf and IIg: Black Terminator Part Number (11/94)

Do the Apple LaserWriter IIf and LaserWriter IIg require a black terminator when a hard drive is attached to the SCSI port?

This article has been archived and is no longer updated by Apple.
Yes. The LaserWriter IIf and LaserWriter IIg require the same black terminator that is used with the Macintosh IIfx.

The finished goods part number for the Apple Terminator II (Black) is M5871G/A.

Article Change History:
11 Nov 1994 - Reviewed for technical accuracy, added finished goods part number.

LaserWriter Printers: Where To Find Paper Specifications

Where can I find information about the recommended paper types for the LaserWriter printers?

This article has been archived and is no longer updated by Apple.

Apple provides general guidelines and specifications for paper used with LaserWriter printers in the LaserWriter User's Guide that accompanies each printer. This information is also available in the Tech Info Library's individual LaserWriter specifications articles. Search the library under "LaserWriter and Specifications".

Apple HDI-30 SCSI Disk Adapter: Cable Pinouts

Here are the pinouts for the Apple HDI-30 SCSI Disk Adapter (M2539LL/A) (service part number 590-0718).
This article has been archived and is no longer updated by Apple.
Apple's SCSI cables are built to tight specifications to minimize electrical noise on the SCSI bus. The wires are laid out to provide minimal signal degradation. Poor quality cable construction may lead to intermittent SCSI operation and potential system crashes.

HDI-30 plug pin layout

Batteries: Apple‘s Lithium Batteries Meet CFR 173.206

I need Materials Safety Data Sheets for all lithium batteries used in Apple products. Our shipper is refusing to ship products until we provide this information.

This article has been archived and is no longer updated by Apple.

The backup batteries used in Apple products contain less than 0.5 g of lithium. Therefore, they meet CFR 173.206 (Code of Federal Regulations) requirements and are considered nonrestricted articles in transportation and should not need Materials Safety Data Sheets.

AppleWorks: Converting PFS File & PFS Write Files

Here are several ways to convert Pascal-based PFS:Write and PFS:File files to AppleWorks.
This article has been archived and is no longer updated by Apple.
PFS:Write

The ProDOS version of PFS:Write includes a conversion program called PFS:Convert, which lets you convert Pascal-based PFS files to the new ProDOS PFS:Write format. Once you've made this conversion, start the ProDOS version of PFS:Write and load the file you want to transfer to AppleWorks. From the PFS:Write Main Menu, save the file using the suffix ".TXT." PFS:Write will now save the file as a standard ASCII file stripped of formatting commands except line breaks. Now you can start AppleWorks, and use the "Make a new document for the Word Processor" function and type in the file's pathname. You will have to reformat the document.

The Pascal PFS Conversion Disk also converts Pascal PFS:Write and PFS:File documents to ProDOS (ASCII) files. Jim Luther, 5716 Forest, Kansas City MO 64110.

The March 1986 issue of Call-A.P.P.L.E. contains a conversion program that you can either type yourself, or download from the A.P.P.L.E. Crate Bulletin Board (206) 251-0543. Call-A.P.P.L.E., 290 S. W. 43rd Street, Renton WA 98055, 206/251-5222.

PFS:File

If your PFS:File records fit within AppleWorks' limits (number of categories and fields) no special preparation is necessary. If you have more categories, than AppleWorks allows, you'll have to decide which are not vital and delete them. If you have fields longer than 76 characters, AppleWorks should truncate the additional characters, but AppleWorks versions earlier than 1.3 don't always do so.

After using the PFS:Convert program that comes with the ProDOS version of PFS:File, use the "Copy Selected Forms to An ASCII File" in the ProDOS PFS:File program, enter the prefix and file name for the new ASCII text file. When the ASCII options menu is displayed, choose a number between 1 and 30 for the "End of item code" and a different number for your "End of form code." PFS:File will convert the file, although somewhat slowly. Now you can start AppleWorks, Make a New file for the Data Base, and Make a new file from a text (ASCII) file. Enter the path name for the file you are about to import. At the prompt, tell AppleWorks how many categories were in each PFS:File record. Give the file you are creating a name and Press Return; AppleWorks will create a database. A word of caution: if you are working with 5.25" disks, you must split PFS files larger than 30K into smaller files.

Jim Luther's Pascal PFS Conversion Disk performs the conversion, but it has some limitations: it takes data only from the first page of PFS:File form, drops any categories after the 30th, and truncates any entries in a category in excess of 78 characters.

The June 1986 issue of Call-A.P.P.L.E. contains another program by Wes Felty, PFS:File to ProDOS ASCII Converter, which you can type yourself or download from the A.P.P.L.E. Crate Bulletin Board.

A commercial program called Bridge converts Pascal PFS:File documents to a DOS 3.3 DIF sequential text file, or to one formatted for DOS 3.3 AppleWriter II. It converts entire PFS:File forms without limitations by the page or the form or the number or length of the categories. Once the file is converted to standard DOS 3.3, you must bring it over to ProDOS with Apple's ProDOS Utilities, System Utilities, or other conversion program. Sun Microsystems, Inc., P. O. Box 1388, Fort Lauderdale, FL 33302, 305/486-6115.

Another Pascal PFS:File to ProDOS conversion method involves the ProFiler program. There are two ProFiler utility programs used to convert PFS:File records to ProFiler records. One program works with Pascal PFS:File records, the other with ProDOS PFS:File records. You can batch process the conversion from PFS by using an Exec file adapted for your own use from a public domain diskette (No. 34) available from TAWUG, The AppleWorks Users Group, P. O. Box 24789, Denver, CO 80224-0869, or you can write to Don Lancaster c/o Computer Shopper for a hardcopy of the program (include a self-addressed stamped envelope). ProFiler is from PM Software, P. O. Box 1788, 17610 Beach Boulevard, Suite 29, Huntington Beach CA 92647, 714/963-2221.

StyleWriter: Troubleshooting Ink Cartridge Problems

These print quality problems have been reported when replacing the StyleWriter Ink Cartridge:

- No print
- Light print
- White lines
- Smudging

This article has been archived and is no longer updated by Apple.
If your StyleWriter exhibits any of these symptoms, here are some things to check:

- Ensure that the orange tape and orange cap have been removed from the ink cartridge.

- Ensure that the black rubber boot isn't missing or twisted.

The rubber boot is located below the home position of the ink cartridge.

- Ensure that you have powered down the StyleWriter using the Power button.

Powering down the StyleWriter with the Power button caps the ink cartridge. Removing the Power Adapter Cord from the back of the printer will not cap the ink cartridge and may result in poor print quality.

- Ensure that you purge the ink cartridge five times before swapping the cartridge and/or modules.

Apple now recommends purging the ink cartridge five times to relieve any obstructions that may have worked their way into the nozzles during transit.

To perform a manual purge:

1) Turn the StyleWriter off with the Power button. (The printer must be turned off.)

2) Press and hold the Ready button.

3) Press the Power button once and release both buttons at the same time.

Macintosh Quadra 900: Supported Drive Configurations

What are the supported drive configurations for the Macintosh Quadra 900?

This article has been archived and is no longer updated by Apple.
These are the supported drive configurations for the Macintosh Quadra 900:

- 1 Apple SuperDrive drive and up to 3 half-height SCSI drives

- 1 Apple SuperDrive drive, 1 full-height SCSI drive, and 1 half-height SCSI drive

The following configurations are supported, but not recommended because the Apple SuperDrive must be removed, which makes system administration and software upgrades difficult:

- 2 removable-media drives and 1 full-height SCSI drive

- 2 removable-media drives and up to 2 half-height SCSI drives

Wang and Macintosh: Document Transfer

This article describes different ways to transfer documents between Wang and Macintosh Systems.

This article has been archived and is no longer updated by Apple.

INTRODUCTION

The Macintosh can be connected to the Wang VS or OIS systems to provide two basic functions: document transfer and translation and terminal emulation.

Document transfer involves the sending of files between the Wang and the Mac. This process also involves translation -- that is, conversion of formatting attributes (like boldfacing, centering, tabs, and underlining) in the Wang documents to their equivalents in the Microsoft Word documents.

As for terminal emulation, the Macintosh can act just like a Wang 2110 VS terminal as long as it is connected to an Enhanced Asynchronous Device Controller (EADC) port on the Wang. This lets the user open a window, on the Macintosh, which is MultiFinder compatible and looks just like a Wang terminal screen. The Wang keyboard is mapped to the Macintosh keyboard, with some Macintosh user interfaces (mouse, pull-down menus, and so on) added for additional ease of use.

The following products provide 2110 terminal emulation: MacLink Plus/Wang VS and VsCom/Macintosh.

Physical Connections

Connections between the Wang system and its dedicated terminals are made via a Wang proprietary coaxial cable. Although this cable is also usable by IBM-compatible PCs, it remains unusable by Macintosh computers.

To connect a Macintosh to the Wang system, use the RS-232 port on the Macintosh side (which can be connected directly to an RS-232 cable if within 50 feet of the Wang system, or via a modem if farther away).

On the Wang side, a number of ports are available:

- Asynchronous Device Controller (ADC): An 8- or 16- port RS-232 device designed for communication with Wang VS terminals.

- Enhanced Asynchronous Device Controller (EADC): Similar to the ADC, except that it also supports word processing.

- Telecommunications Input/Output Processor (TC-IOP): Provides limited access to Wang software applications, is less sophisticated.

- Multi-Line Telecommunications Controller (MLTC): Similar to the ADC, except that it is used on large Wang VS systems.

- Wang Asynchronous Controller System (WACS): Similar to the EADC, except that it is used on large Wang VS systems.

All these ports support most Wang functions, like communications with the Wang system, file transfer and conversion, and so on, but only the EADC and the WACS support Wang word processing on the Macintosh.

CONNECTIVITY SOFTWARE AVAILABLE

This section describes five transfer products (an asterisk indicates

terminal emulation capability):

- MacLink Plus/Wang VS* and MacLink Plus/Wang OIS

- VsCom/Macintosh*

- Converse

- Smart Kid

MacLink Plus/Wang VS

Strengths

- Two-way file transfer and translation between Wang WP and Microsoft Word on the Macintosh

- VS 2110 terminal emulation (supports all Wang characters in the ADC/EADC version)

- Bidirectional copy/paste between Macintosh and Wang

- Multiple document transfer and conversion

- Includes a full set of PC-to-Macintosh translators

- Also includes the Allegro Server/VS FeaturePack, which provides:

- Security subsystem to prevent unauthorized access to files

- Document indexing subsystem to enable users to search for files on the basis of author, title, and other fields from the document summary (similar to the Wang summary)

- Wang Office interface module that provides access to the mail and messaging functions in the Wang OFFICE. Note that it does not provide access to OFFICE's calendar and bulletin board capabilities.

Limitations

MacLink Plus/Wang VS does not support:

- Headers, footers, and footnotes during document conversion

- Background transfer/conversion of files

MacLink Plus/Wang OIS

Strengths

- MacLink Plus/Wang OIS transfers/converts files between Wang OIS and MS-Word on the Macintosh

- It includes a full set of PC-to-Macintosh translators.

Limitations

MacLink Plus/Wang OIS does not support:

- Headers, footers, and footnotes during document conversion

- Direct conversion to/from Wang WP Plus

- Background transfer/conversion of files

For details on MacLink Plus products, contact DataViz, Inc. You can find contact information in the Third Party Company Directory folder in the Tech Info Library.

VsCom/Macintosh

Strengths

- Provides basic document transfer/translation between Wang VS and Microsoft Word on the Macintosh: Supports both WP and WP Plus,

- Direct Wang Office interface: Simple one-step transfer of documents in and out of Wang Office mailboxes

- VS 2110 terminal emulation (supports all Wang characters)

- Bidirectional copy/paste between Macintosh and Wang

- Multiple document transfer and conversion

- Headers and footers supported in document conversion

Limitations

VsCom/Macintosh does not support:

- Background document transfer and conversion

- Footnote conversions

- No TC-IOP port version

For details on VsCom/Macintosh, contact M/H Group. You can find contact information in the Third Party Company Directory folder in the Tech Info Library.

Converse

Strengths

Converse provides simple document conversion and terminal emulation capabilities.

Limitations

Converse does not support:

- Multiple document transfer and conversion capability

- Terminal emulation

- Background transfer and conversion of documents

For details on VsCom/Macintosh, contact MacSoft. You can find contact information in the Third Party Company Directory folder in the Tech Info Library.

Smart Kid

Strengths

- Permits almost 100 percent file conversion including headers, footers, and footnotes.

- Very versatile: Works with a variety of systems and word processing formats.

- Toll-free telephone support.

Limitations

- Requires a Wang operator to send or receive files.

- Does not support background transfer and conversion of documents.

Comments

Smart Kid is a hardware and software product that handles file conversion between Wang VS or Wang OIS and a host of other computer systems, including Macintosh, IBM Displaywriter, Digital VAX, Xerox Memorywriter, and NBI OASys. It is a more expensive option, but, because of its sophisticated file conversion capabilities, it is sometimes chosen by companies that use long, heavily formatted documents.

For details on VsCom/Macintosh, contact MacSoft. You can find contact information in the Third Party Company Directory folder in the Tech Info Library.

System 6.0.x Installation (10/94)

To install System 6, follow these instructions in the order presented. These instructions apply to all versions of System 6 (6.0.1, 6.0.5, 6.0.7, and so on).

This article has been archived and is no longer updated by Apple.

REQUIRED DISKS

System 6 software comes as a set of 800K (double-density) disks or a set of 1.44MB (high-density) disks:

The set of four 800K disks includes System Tools, Utilities 1,

Utilities 2, and Printing Tools.

The set of two 1.44MB disks includes System StartUp and System

Additions.

The instructions in this document give the name of the 800K disk first, followed by the name of the 1.44MB disk in parentheses.

BACK UP FONTS AND DESK ACCESSORIES

Before you install System 6, back up your fonts and desk accessories. You can back up fonts and desk accessories using the Font/DA Mover. Or you can make a copy of the System file on a floppy disk, and remove the fonts and desk accessories later, using the Font/DA Mover.

PREPARE FOR A CLEAN INSTALLATION

---

1) Start up with the System Tools (or System Startup) disk. To do

this, turn on your Macintosh computer. If your Macintosh is already

on, choose Restart from the Special menu.

2) Put the System Tools (or System Startup) disk into the startup

floppy drive right after you hear the chime. The floppy disk icon

appears in the upper-right corner of the desktop above the hard

disk's icon.

If it doesn't appear there, choose Restart from the Special menu.

The disk ejects push it back into the drive immediately.

3) Double-click your hard-disk icon to open it.

4) Double-click your System Folder to open it.

5) Drag the Finder and System files to the Trash, and choose Empty Trash from the Special menu.

INSTALL SYSTEM 6

---

1) Double-click the System Tools (or System StartUp) disk icon.

2) Double-click the Installer icon (not the Installer script). A welcome message appears.

3) Click the OK button. The Easy Install screen appears.

At this point you have two options:

Easy Install, which installs the Macintosh system software and printer software recommended for your computer model.

Customize Install, which lets you override the recommended software and choose exactly what items to install.

Note: You must use the Customize option to install AppleShare workstation software.

Easy Install

---

1) Click the Switch Disk button to select the disk where you want to install System 6.

2) Click the Install button to do the Easy Install.

3) Follow the instructions on the screen. Messages appear to prompt you for the proper disks. When installation finishes, a message appears.

4) Click the Quit button.

5) Choose Restart from the Special menu.

Customize Install

---

1) Click the Customize button. A screen appears.

2) Click the Switch Disk button to select the disk where you want to install System 6.

3) Select the items you want to install from the scrolling window. Hold the Shift key and click to select multiple items. Your selections appear beneath the scrolling window.

4) When you've made your selections, click the Install button.

5) Follow the instructions on the screen. Messages appear, prompting you for the proper disks. When installation finishes, a message appears.

6) Click the Quit button.

System 6 MultiFinder (10/94)

MultiFinder lets you have several programs open simultaneously, making it fast and easy to switch between them. You can print in the background and get the use of your Macintosh computer back faster. And you can allocate memory to programs, so you can get the most out of your available RAM.

With versions of System 6, the Finder is one of these programs. This means you don't have to quit the program you're running to work in the Finder.

This article has been archived and is no longer updated by Apple.

Setting up MultiFinder

You need at least 2 megabytes (MB) of Random Access Memory (RAM) to take advantage of MultiFinder. To run MultiFinder, the MultiFinder file must be in your System Folder. If not, copy it from your Utilities 1 disk to the System Folder on your hard disk.

You can launch MultiFinder from the Finder in System 6 by opening the System Folder and double-clicking on the MultiFinder icon. To set your system to launch MultiFinder each time you start your Macintosh computer, follow these steps:

1) Choose Set Startup... from the Special menu. A dialog box appears.

2) Click the MultiFinder radio button.

3) Click the OK button.

4) Choose Restart from the Special menu.

How to Tell If MultiFinder Is Running

To find out if you're running MultiFinder, open the Apple menu. If you're in MultiFinder, you'll see About MultiFinder... at the bottom of the menu. You'll also see application names below the desk accessories if they're loaded into memory.

Another way to tell is by looking at the far right of the menu bar. If you're in MultiFinder, you'll see either a small Macintosh icon, or an application icon. In addition, the About the Finder... window changes when you're running MultiFinder. It not only shows memory allocated to the System and Finder, but also to other programs loaded in RAM. You always want to see some white space for applications on this graphic barometer.

Switching Between Applications

MultiFinder lets you switch between applications in several ways:

Choose the application name from the Apple menu.

Click the small icon at the far right of the menu bar. Repeated

clicking cycles through all the open programs.

Click the visible portion of another application's window.

Double-click an application icon, even if it's dimmed.

Memory Allocation

In MultiFinder, each application gets its own portion of memory that belongs solely to that application. Every application comes with a default amount of memory assigned to it, but sometimes you'll get a message that there isn't enough memory to run the program, or that the application has unexpectedly quit. You can fix this by changing the program's memory allocation.

1) Quit the application (no need to do this if the application has

already quit).

2) At the desktop, select the application icon.

3) Choose Get Info from the File menu (or press Command-I). The Get

Info window appears.

4) Select the Application Memory Size box.

5) Type a new number in the box. Make sure the number you use isn't

less than the Suggested Memory Size. It's best to increase the

memory size by only 50K to 100K at a time. You can always repeat

the procedure if it isn't enough.

6) Close the Get Info window.

You can now launch the application again. The application will get this new memory size until you change it.

Note: When using MultiFinder with System 6, the Finder should get 250K as the minimum size. Use the Memory Allocation procedure to increase the Finder's memory. Restart so the new memory allocation takes effect.

Desktop Network Troubleshooting

This quick reference will help you diagnose common connectivity problems in your Local Area Network (LAN). With this information, you can fix the problem yourself, or give support personnel the most helpful information.

The topics include:
* Overview
* LAN defined
* LocalTalk/PhoneNET hardware
* Checking LocalTalk connections
* Checking the Chooser
* LocalTalk hints and help
* EtherTalk hardware
* Checking Ethernet connections
* Checking the Network Control Panel Device (System 6.0.x)
* Checking the Network Control Panel Device (System 7.x)
* EtherTalk hints and help
* Where to get more information

This article has been archived and is no longer updated by Apple.

LAN Defined

A Local Area Network, or LAN, is made up of computers and shared devices that are physically connected in a limited area. A shared device can be a LaserWriter printer, modem, file server, or print spooler. The two major network types discussed here are LocalTalk/PhoneNET (PhoneNET is a LocalTalk cabling system by Farallon Computing, Inc.) and EtherTalk.

LocalTalk/PhoneNET Hardware

A LocalTalk/PhoneNET network uses the following hardware:

1) Connector module

2) Standard phone cable

3) Terminating resistor

Checking LocalTalk Connections

Follow these steps to check LocalTalk connections:

1) Each Macintosh on the LocalTalk network should have the 8-pin (round) end of the connector module plugged into the Printer port.

2) Each shared device on the LocalTalk network should have the 8-pin (round) end of the connector module plugged into the Network (»¡) port.

3) Standard phone cables connect the computers and shared devices in a LocalTalk network. The box end of the connector module has two phone jacks. Either two phone cables, or one phone cable and one terminating resistor, should be attached.

Checking the Chooser

The Chooser can give you valuable information about the network. This section includes a list of questions to help you collect worthwhile information for support personnel. Select Chooser from the Apple menu, and the Chooser window appears. Here are the questions:

1) Is the AppleTalk Active radio button selected?

2) Do you see the AppleShare icon in the (upper-left) box?

3) Do you see any names in the file server (upper-right) box?

4) Do you see the name of the file server or shared disk you want in the file server (upper-right) box?

5) Do you see any zone names in the AppleTalk Zones (lower-left) box?

6) Do you see only a few zone names in the AppleTalk Zones (lower-left) box?

7) Do you see your zone name in the AppleTalk Zones (lower-left) box?

LocalTalk Hints and Help

If you're having problems, try these tips:

* Select Shut Down (not Restart) from the Special menu, wait 30 seconds, and then power on. This simple procedure often fixes the problem.

* Try swapping out the various hardware components (terminating resistor, connector module, and phone cable) one at a time.

WARNING: ALWAYS SHUT DOWN BEFORE MAKING ANY HARDWARE CHANGES.

* Re-install the AppleShare Workstation (System 6.0.x) or File Sharing (System 7.x) software.

Ethernet Hardware

An Ethernet network uses the following hardware:

* Ethernet NB Interface Card -or- built in Ethernet AUI (Attachment Unit Interface) port

* Ethernet (coaxial) cable -or- twisted pair (telephone) cable

* BNC T-connector -or- an Apple Ethernet NB Transceiver, often referred to as a "friendly-net connector". Apple Ethernet NB Transceivers are available in two varieties:

Apple Ethernet Thin Coax Transceiver (M0329LL/A)
Apple Ethernet Twisted Pair Transceiver (M0437LL/A)

Checking Ethernet Connections

Make sure the basic Ethernet connections are correct:

1) Does each Macintosh on the EtherTalk network have an EtherTalk Interface Card installed -or- is using the built Ethernet AUI port?

2) Does each Macintosh on the EtherTalk network have the BNC T-connector plugged into the round connector on the installed on the older EtherTalk NB Card -or- a Transceiver plugged into the AUI port on the newer Ethernet NB Card.

3) Check the jumper on the EtherTalk NB Card to ensure that the EtherTalk signals go out the right port (preset for AUI). The jumper area is located near the bottom end of the card near the connectors. There are three pins of which the jumper sets over two. With the EtherTalk NB Card face up, and the connectors to your right, when the jumper is on the left two pins the signal goes out the AUI port, and when the jumper is on the right two pins the signal goes out the BNC port.

* EtherTalk NB Cards are shipped with the AUI port as the default.

* The Apple AUI port, which looks similar to a video card port is slightly larger.
* The BNC port. This is a round port, similar to a cable television cable plug.

4) Do the network LaserWriters and ImageWriter printers still use LocalTalk? (The EtherTalk network is joined to the LocalTalk network to access these printers by using either a bridge, or router.) See steps 2 and 3 in the "Checking LocalTalk Connections" section.

5) Are coaxial cables connecting the computers and devices in the EtherTalk network? There should be a cable attached to each end of the BNC T-connector -or- the Ethernet Thin Coax Transceiver. If the computer is last on a particular Ethernet segment, the BNC T-connector a cable attached to one end, and a terminator attached to the other end.

6) Is the latest Networking software installed? Update your AppleTalk EtherTalk, or TokenTalk software using the latest version of the Network Software Installer disk.

IMPORTANT: You cannot use the older EtherTalk NB Card in a Macintosh Quadra or later. You MUST use either the on-board AUI port or the newer Ethernet NB Card.

Checking the Network Control Panel Device (System 6.0.x)

If you're running System 6.0.x, follow these steps to check your Control Panel device:

1) From the Apple menu, select Control Panel.

2) Click the Network icon and the Network window appears.

3) Is the EtherTalk icon selected? If not, click the icon name to select it.

4) Close the Control Panel window.

Checking the Network Control Panel Device (System 7.x)

If you're running System 7.x, follow these steps to check your Control Panel device:

1) From the Apple menu, select Control Panel.

2) Double-click the Network icon. The Network window appears.

3) Is the EtherTalk icon selected? If not, click the icon name to select it.

4) Close the Network window.

5) Close the Control Panels window.

EtherTalk Hints and Help

Keep these tips in mind when troubleshooting:

* Select Shut Down (not Restart) from the Special menu, wait 30 seconds, then power on again. This simple procedure often fixes the problem.

* Check that the Ethernet Interface Card is seated properly.

WARNING: ALWAYS SHUT DOWN BEFORE MAKING ANY HARDWARE CHANGES.

* Try swapping out the Ethernet Interface Card.

* Re-install the EtherTalk software from the latest version of the
Network Software Installer disk.

How to Use SCSI Probe (5/97)

SCSI Probe is a utility program that gives you information on each SCSI device (like hard disks, CD-ROM drives, tape backup drive, removable drives) connected to your system. For each device, SCSI Probe includes the SCSI number, the manufacturer, and version.

SCSI Probe also lets you mount and unmount devices. That is, you can make the Macintosh aware of a SCSI device (mount) or unaware of a device (unmount). If your hard disk icon doesn't appear on the desktop after you start your Macintosh, SCSI Probe can sometimes get it to work. SCSI Probe can also help you track down SCSI address conflicts.

This quick reference covers the following topics:

- Installation and use

- Hints and help

- Where to get more information

This article has been archived and is no longer updated by Apple.

Installation and Use

Follow these steps to install and use SCSI Probe:

1) Drag SCSI Probe to your System Folder. It will be placed in the Control Panels folder.

2) Select Control Panel from the Apple menu.

3) In the Control Panel, select the SCSI Probe icon. A window appears.

4) Click the Update button to update the device list for your current configuration.

5) To mount a SCSI device, click the Mount button. If SCSI Probe is successful in mounting the device, its icon will appear on your desktop.

Hints and Help

If you've had to use SCSI Probe to mount a hard drive, be aware that it's only a temporary fix. Make sure you back up the data on that hard disk before shutting down again. Then determine if your hard disk drive needs to be reinitialized or repaired.

Where to Get More Information

The Macintosh Bible by Naiman, Dunn, McCallister, and Kadyk - Fourth Edition has some additional information about SCSI Probe and other shareware utilities.

Quick Reference: Using SmartForm Assistant

This quick reference describes how to use Claris' SmartForm Assistant program. Use this application to print professional-looking forms with high-quality graphics and legible, accurate data. SmartForm Assistant forms are organized so you can enter data easily.

A form designer can program SmartForm Assistant forms to calculate automatically, to check the data you enter, and to provide help when you're filling in a form -- things you can't do with paper forms. You can also export the data in your forms to a database or spreadsheet application.

This quick reference is based on SmartForm Assistant 1.1v2, and covers these
- Getting started

- Filling in a form

- Printing a form

- Using support features

- Managing a form set

- Where to find more information

This article has been archived and is no longer updated by Apple.

Getting Started with SmartForm Assistant 1.1v2

There are four ways to begin filling in a form using SmartForm Assistant:

- Double-click a form.

- Highlight the SmartForm Assistant application icon, pull down the File Menu and select the Open option.

- Double-click the application icon. SmartForm Assistant displays the Open file dialog box. Select the form you want to fill in from this list.

- If you have a set of forms already open, you can pull down the Edit menu and select Add Blank Form to create a blank form. Use this method if you need to fill in multiple copies of the same form in a single session. Also, use this method to create forms requiring unique form numbers.

Note: Throughout this quick reference document, Command-key equivalents are shown in parentheses ( ). You can press these instead of going to menus to select options.

Filling in a Form

Here's how to fill in a form:

1) After you have gotten started with SmartForm Assistant, choose the appropriate form.

2) Once the form set is open, pull down the Edit menu and select Add Blank

Form (Command-A). This adds a blank form to your set of forms.

3) Type in the required information. Use the Tab and Shift-Tab (backwards tab) to move from field to field. If you have any difficulties, see the section below, "Using Support Features" for on-line help.

4) When you complete the form, save the information to your hard disk or floppy for archiving purposes. You are ready to print your form(s).

Printing a Form

1) Pull down the File Menu and select Print (Command-P). If a form requires you to print multiple copies, click the "Print with part labels" option in the print dialog box.

2) You can print The Current Form, All Forms, or Visible Forms. Make your selection by using the pop-up menu on the print dialog box. The choice defaults to Print Current Form.

Using Support Features

This section explains two categories of Support Features:

- Intelligent Assistance, which deals with things you need to know immediately.

- General forms Assistance, which contains information needed by more advanced users.

Intelligent Assistance

SmartForm Assistant provides three types of intelligent assistance. These are menu items that help you fill in forms quickly and accurately. These include Format Help, Support window, and Choices window.

- Format Help dialog box. This feature describes the different types of entry formats. SmartForm Assistant provides Format Help on all forms. The form designer must provide Support and Choices, which vary among forms.

Format Help dialog box. The Format Help dialog box provides a concise explanation of the correct entry formats for each data type. The form designer can define a field as one of ten data types: text, decimal, integer, date, time, name, phone, international phone, logical, or picture. To display the Format Help dialog box, pull down the View menu and select Format Help... (Command-?) after you open a form.

- Support window. This feature describes the type of information to enter. The form designer can also provide custom help messages and custom error messages for each field in a form. These messages apply to the selected field and appear in the Support window. To display the Support window, pull down the Windows menu and select Show Support (Command-H).

- Choices window. This feature lists choices for the selected field. After selecting or tabbing to a field, you can enter data into it by typing, by pasting from the Clipboard, or by selecting an option from the Choices window. As with the Support window's help and error messages, choices are not built into all forms; the form designer must

provide them. Some forms, or fields in a form, may not have choices associated with them.

To display the Choices window, pull down the Windows menu and select Show Choices (Command-Y). You can select items from the Choices window by:

- Selecting an item in the choice list and then clicking the Select button.

- Double-clicking an item in the choice list.

- Pressing the Command-key equivalent corresponding to the choice you want (Command-key equivalents for the first 10 choices are always Command-1 through Command-9, then Command-0).

General Forms Assistance

Beyond the intelligent assistance provided by Format Help, Support, and Choices, the following features help ease data entry and provide information about the form or its data. These include Name Options..., the Form Info window, the Form Set Info window, and the Auxiliary window.

- The Name Options... dialog box shows prefixes and suffixes (like Mister and Senior) that help SmartForm Assistant interpret acceptable entries in a Name field. It also controls how SmartForm Assistant displays your accepted entry. Some prefixes and suffixes also have abbreviations (Mr. and Sr., for example) and alternate abbreviations (Mr and Sr), which you can view in the Name Options dialog box.

To display the Name Options dialog box, pull down the View menu and select Name Options... The "Built-in" card displays name options for all forms; the "User-defined" card displays them for a specific form set; the "Library" card displays a list of name options that you define (for example, making Research Engineer, Researcher, or R.E. acceptable).

- The Form Info window displays data about the form with which you're working. The Form Info window displays the Form Name, number, and the creation and last modified dates for the current form. It also includes a field into which you can enter comments about the current form. To display the Form Info window, pull down the Windows menu and select Show Form Info (Command-T).

- The Form Set Info window, displays data about the current form set. The Form Set Info window displays the date the Form Set was created and last modified and information about the Source Form (the form created in SmartForm Designer). It also includes information about the total number of forms in the set, number of visible forms, and number of hidden forms. To display the Form Set Info window, pull down the Windows menu and select Show Form Set Info (Command-M).

- The Auxiliary window is an extra page, consisting of information that will not be printed with the rest of the form. The Auxiliary window contains extra information that SmartForm Assistant does not print. To display the Auxiliary window, pull down the Windows menu and select Show Auxiliary (Command-U).

Managing a Form Set

When you have a number of forms to keep straight -- as with numerous weekly expense reports in the same file -- you can search through old forms and manage forms more easily with the controls First Form, Next Form, Previous Form, and Last Form. These items are in the View Menu. When you want to

view a different form in the set, use these menu items to move through the form set.

Find Forms...

This is used to find a specific form. To find a form, pull down the View Menu and select Find Forms... (Command-F) and a blank form will appear. Determine which field you want to search on and enter the search criteria into that field. To find a form that was created on 7/25/88, you'd enter 7/25/88 as the search criteria in the date field and then click Find in the find dialog box. To find a Facilities Work Request form for reconfiguration of cubicles, you would open the Facilities set of forms, pull down the View menu and select Find Forms..., and enter "reconfigure cubes" in the comments field. The program would find the form in which you entered "reconfigure cubes" in the comments field.

Hide Current Form, Swap Hidden-Visible, or Show All Forms

These menu options are used to manipulate forms in a set after you have searched for a form(s). Suppose you fill in forms for John Doe and Sally Smith. There are 10 forms in the set with John's name, and 5 with Sally's name. Sally has just asked you to print all of her forms. You would pull down the View Menu, select Find Forms..., enter = Smith and click Find on the dialog box. You'd now have 5 forms visible and 10 forms hidden. Now you pull down the File Menu, select print and choose Print Visible Forms from the pop-up menu.

If you wanted to see all of John's forms, you'd pull down the View Menu and select Swap Hidden-Visible (Command-J). John's 10 forms would be visible and Sally's 5 forms would be hidden.

Collect...

The Collect feature lets you take a form that you've already filled out and collect all similar forms to create a form set. For example, if you created 15 Vacation Leave forms, you have 15 different files. If you wanted to examine the one you filled out last week, you'd have to search through your hard drive and open that file. But, using SmartForm Assistant 1.1v2, you open one of those Vacation Leave forms, pull down the File menu and select Collect. Select the folder that has the 15 vacation forms in it and Collect forms into "the current [front-most] set". Watch the dialog box compare each file and collect the ones that match the type of form that is open. This gives you a set of 15 vacation forms.

You can also collect forms by launching SmartForm Assistant, pulling down the File Menu, selecting Collect, choosing the file you want to collect, and clicking Collect forms into "a new set of forms". The application will search for all the files that match the chosen form type.

Kanji: LaserWriter IINTX-J Is Recommended Solution

Article Change History

09/22/92 - UPDATED
* To include information on Kanji TrueType and ATM-J fonts.

Is a Japanese version of the LaserWriter IIg available?

This article has been archived and is no longer updated by Apple.
As of 2/8/92, a Japanese version of the LaserWriter IIg is not available. When Kanji Postscript is required, the LaserWriter IINTX-J is the recommended LaserWriter solution. Kanji TueType and ATM-J fonts are also available and will enable high quality printing to QuickDraw printers.

Published Date: Feb 18, 2012

MacX 1.1.7 Font Error

I've encountered a problem using MacX 1.1.7 and MacTCP 1.1 on a Macintosh IIfx using system software versions 6.0.5 and 7.0. I used it to display the Euclid program (CAD 2D and 3D). After launching the program, I got the message:

"X Toolkit Warning: Cannot convert string "-*-MENU-MEDIUM-R-Normal--*-120-*-*-P-*ISO8859-1" to type FontList, using fixed point."

Do you have any suggestions?

This article has been archived and is no longer updated by Apple.
Here are some possible causes of this problem:

- The proportional font "-*-MENU-MEDIUM...." doesn't exist in the Font Directory file or MacX Fonts folder. Select Fonts from the Edit menu to verify that this font exists.

- The Font Directory file might be out of sync due to improper removal of fonts or font aliases.

We suggest that you reload the MacX fonts from the MacX 1.1.7 distributed disks, (especially the "Font Directory"), and launch MacX again.

AppleTalk Remote: Troubleshooting Inability to Reach TCP/IP Host

We're using MacTCP with a Macintosh on Ethernet configured for TCP/IP (as opposed to AppleTalk - encapsulating IP with DDP). This works fine. When using AppleTalk Remote Access however, the Macintosh that is dialing in must use AppleTalk (since the link is AppleTalk only).

When we configured MacTCP on the PowerBook, we chose AppleTalk and the LocalTalk side of a FastPath 4 that was configured to route TCP/IP. This K-box works fine for Macintosh computers on LocalTalk. With AppleTalk Remote Access, however, we can't reach a TCP/IP host. We get a "host not found" message. In addition, when we configured MacTCP on the host Macintosh (sitting on Ethernet) for AppleTalk encapsulation of IP, we couldn't reach the host either.

Since I always used just the TCP/IP configuration of MacTCP before, I'm not sure what is going wrong. Is there something in the K-box we need to change? Something in the MacTCP configuration?

Configuration:
- Macintosh IIci
- MacTCP 1.1
- System 7
- Apple Ethernet (old) card
- Shiva FastPath 4

This article has been archived and is no longer updated by Apple.
First you should make sure the FastPath is running either K-Star or KIP. If it's using the default ROM code, you won't be able to use it as a DDP/IP gateway.

Next you should verify the configuration:

- Check to see if the DDP/IP gateway was configured at all. You should see a startup message in the log or diagnostics windows that begins with "KSTAR FastPath ..."

- Check that there are IP addresses assigned for either static or dynamic allocation, or both. Verify that the IP address, default router, and subnet mask fields are configured properly.

- Verify that option 7 is turned on; this allows the Fastpath to respond to NBP lookups for "IPGATEWAY" from both the LocalTalk and Ethernet interfaces. We suspect that option 7 may be your culprit. KSTAR 8.1.1 hard wires option 7 on, so you don't have to worry about it if you're using 8.1.1.

You could use Inter*Poll to verify that the FastPath was advertising DDP/IP services. Perform a lookup for all nodes of type "IPADDRESS" Every node assigned a DDP/IP address will respond including the FastPath itself. The router should respond with something like:

Net	Node	Name	Type	Zone
1	220	192.11.0.200	IPADDRESS	LocalTalk

If you then do a lookup for all nodes of type "IPGATEWAY" you should see only the router respond, no end nodes, and hopefully only one router per zone.

Net	Node	Name	Type	Zone
1	220	192.11.0.200	IPGATEWAY	LocalTalk

By default it will only respond to lookups that are directed from the LocalTalk port. If option 7 is enabled, the FastPath will respond to lookups from the Ethernet port, but only if they are directed to the zone for which the LocalTalk port is configured. For example, assume you have a FastPath, with the LocalTalk port configured for zone "LocalTalk," and the Ethernet port configured for zone "EtherTalk." You must select the zone "LocalTalk" when you configure the DDP/IP gateway location in the MacTCP control panel from an Ethernet attached Macintosh, or from a remote LocalTalk attached Macintosh. If you don't select "LocalTalk," the FastPath won't respond to lookups for "IPGATEWAY." The key here is to select the correct zone, the zone configured for LocalTalk interface of the FastPath.

In their documentation, Shiva is a little more restrictive. They specify that the Ethernet port of the FastPath must have the same zone included in its zone list as the zone configured on the LocalTalk interface. They also specify that all nodes managed by a single gateway MUST be in the same zone as the LocalTalk interface for this gateway. The DDP/IP gateway as a whole isn't a documented standard. As long as you use only dynamic assignment, you shouldn't have any problem with the scheme outlined above. With version 8.1.1 of K-STAR, it looks like you should be able to use this type of scheme with static addresses as well. I haven't tested this, but the documentation included with 8.1.1 seems to indicate that they've made some significant improvements to address assignment.

From the K-STAR 8.1.1 release notes:

Changes made to K-STAR to avoid dynamic IP addresses that are still in use from being given away are:

a. IP in AppleTalk traffic from each Macintosh is used to reset the aging timer.

b. While entries idle (those which have not sent an NBP reply for its IPADDRESS, or any IP traffic) for over 5 minutes will be considered for reuse; the FastPath will send directed IPADDRESS NBP lookups to the Macintosh for 10 minutes after the last response was seen.

c. The FastPath performs a wild card IPADDRESS lookup in the local (LocalTalk) zone every 30 minutes.

d. Previously, the FastPath would hold an IP packet for an address in its client range for up to 30 minutes in the hope that the client would respond to the (initial) NBP ARP. The FastPath no longer holds such packets.

e. Previously, the FastPath stopped keeping track of how old entries were after 30 minutes. Now times are kept up to 2^15 seconds (over 9 hours) to better distinguish between old and very old entries when deciding which entry to reuse.

f. The FastPath will only respond to "NBP PROXY ARPs" (Mac sends an IP ARP request by doing an NBP lookup for type IPDARESS, name xx.xx.xx.xx) if they originate from a Macintosh which is a registered client. This enables two FastPath IPGATEWAYs to coexist in the same zone. Since 2 IPGATEWAYS can coexist, the FastPath now always responds to IPGATEWAY lookups; this is as if option 7 was always enabled.

Finally, take a look at the TCP/IP configuration of the remote Macintosh as well as the Ethernet based Macintosh that also failed. What do they have in the way of configuration data? What zone are they pointed to for the DDP/IP gateway lookup? Are they configured for "Server" node address access? What zone do they reside in? Have you tried static address assignment?

Personal LaserWriter NT: Minimum Margin Reduces Lines Per Page

I have a Macintosh LC with 2MB RAM and an HD40 SC running system software version 6.0.8. I have an Apple IIe Card installed and am printing to a Personal LaserWriter NT from AppleWorks and Publish It.

When printing, the print starts an extra half-inch down the page, thereby misaligning subsequent pages -- the last page of one print job I measured had a top margin of 4 inches.

Is there a compatibility problem with the Apple IIe Card and the Personal LaserWriter NT?

This article has been archived and is no longer updated by Apple.
This indicates that software is not properly configured for the correct number of lines per page. The Personal LaserWriter NT has a minimum margin that reduces the number of available lines per page to 61 from the usual 66 lines for an 8.5x11 page. Configure your software accordingly.

The Apple IIe Card version 2.0 software uses the printer driver in the Macintosh System Folder. Ensure that you have the Courier 10-point font installed.

Lisa 7/7: Installing OS 3.1 & Pascal Workshop 3.0 on Hard Disk

This article has been archived and is no longer updated by Apple.
To install Lisa 7/7 Office System 3.1 or 3.0 and Pascal Workshop 3.0 on a hard disk:

1. Backup any Office System or Macintosh documents from the hard disk.

2. Install the 7/7 Office System (release 3.0 or 3.1) as detailed in Chapter 6 of the Lisa Office System manual.
a. Select Erase when prompted.
b. Select Share if you wish to store Macintosh software on the hard disk

3. Install the Pascal Workshop as described in Chapter 1 of the Lisa Workshop manual. Select Don't Erase when prompted.

4. If you installed release 3.0 in step 2 above and want to upgrade to 3.1,
a. Get into the Workshop environment and insert the Release 3.1 Office System 2 diskette into the microdrive.
b. From the Workshop command line, type R.
c. When asked which file you wish to run, type: <-lower-StartUpdate.
d. Press the RETURN key.
e. You are then guided through the process of updating the system libraries. After answering a series of questions, follow the prompts to insert the necessary disks.
f. Since the update process changes the libraries on the startup disk,
1. Restart the Lisa when you've completed step 4e.
2. Replace the LisaWrite and LisaProject tools and stationary pads on the hard disk with the updated versions.

System 7: File Sharing Is Not the Same as AppleShare File Server

Article Change History

09/10/92 - REVIEWED
* For technical accuracy.

I have a Macintosh running system software version 7.0 and sharing one folder. No one uses this computer; it acts as a file server only. The folder sharing function works fine with up to 10 users logged on. However, when an eleventh user tries to log on, one of these two messages appears:

- File server will not allow any users to log in. Try again later.
- Too many AppleTalk connections in use. Try again later.

The documentation says that up to 250 users are allowed per System 7 server.

This article has been archived and is no longer updated by Apple.
Your Macintosh SE/30 is not a dedicated server. It is a system running the system software version 7.0 file sharing option. With that configuration, you are limited to 10 users.

To make the Macintosh SE/30 a dedicated file server, you need to install and run the AppleShare File Server software.

Apple IIGS: Apple GS/OS 6.0 Supports the StyleWriter (7/94)

Can I use the StyleWriter with an Apple IIGS?

This article has been archived and is no longer updated by Apple.
To use Apple GS/OS with the StyleWriter you need GS/OS 6.0, a hard drive and at least 1 megabyte of memory (more is preferred).

Earlier versions of Apple GS/OS do NOT support the StyleWriter.

Known Problem
---
* AppleWorks GS prints to the StyleWriter printer with GSOS 6.0. At full resolution of 360 dpi, however, full justification will not work and causes problems with spacing between words.

Work Around
---
* Choose half resolution (180 dpi), then full justification works.

Article Change History:
6 July 1994 - Added known problem.
5 May 93 - Revised to include hard disk and memory information.

LaserWriter/LaserWriter Plus: External Pinouts (7/94)

What are the external signals associated with the DB-25 and DB-9 connectors on the LaserWriter and LaserWriter Plus?

This article has been archived and is no longer updated by Apple.
Here are the pinouts and signal names for the LaserWriter and LaserWriter Plus.

DB-25
Connector Signal Name

1 ..... Frame Ground
2 ..... Transmit Data (Tx)
3 ..... Receive Data (Rx)
4 ..... Request to Send (RTS)
7 ..... Signal Ground
20 ..... Data Terminal Ready (Tx)

NOTE: The other signals are not used.

DB-9
Connector Signal Name

1 ..... Chassis Ground
3 ..... Signal Ground
4 ..... Transmit Data (Dx+)
5 ..... Transmit Data (Tx-)
7 ..... Data Set Ready (DSR)
8 ..... Receive Data (Rx+)
9 ..... Receive Data (Rx-)

NOTE: RTS and DTR are only present for the convenience of the computer that the LaserWriter is attached to. You should use Xon/Xoff for flow control.

Apple Daisy-Wheel Printer: Pinouts for IBM PC, XT, PS/2

Can I connect an Apple Daisy-Wheel Printer to an IBM PS/2/30? If yes, what are the cable pinouts?

This article has been archived and is no longer updated by Apple.
Yes, you can connect an Apple Daisy-Wheel Printer to an IBM PS/2/30. You may have a problem with a driver, though. Try setting your applications to print to a Qume-type printer.

Here's the cable pinout information for connecting an Apple Daisy-Wheel Printer to an IBM PC, XT, or PS/2 series:

IBM RS-232 Serial Apple Daisy-Wheel Printer
(DB-25 -- Female Connector) (DB-25 -- Male Connector)

1 ---------- 1
2 ---------- 3
3 ---------- 2
4,5 ---------- 8
6 ---------- 20
7 ---------- 7
8 ---------- 4,5
20 ---------- 6
22 ---------- N.C.

Reference:

RS-232 Signal (DB-25 .. DTE)
1 - Sig Gnd - Normally Shield or Chassis Ground
2 - TXD - Transmit Data
3 - RXD - Receive Data
4 - RTS - Request to Send
5 - CTS - Clear to Send
6 - DSR - Data Set Ready
7 - GND - SIGNAL Ground
8 - DCD - Data Carrier Detect
20 - DTR - Data Terminal Ready
22 - RI - Ring Indicate

HyperCard: Which Version for Which System

I need to know what version of HyperCard to use with my version of system software.
This article has been archived and is no longer updated by Apple.
The following guide can help you find the correct version of HyperCard to use with your version of system software.

System	HyperCard
5.0	1.2.2
5.1	1.2.2
6.0.2	1.2.2
6.0.3	1.2.2
6.0.4	1.2.2, 1.2.5
6.0.5	1.2.2, 1.2.5, 2.0, 2.0v2, 2.1, 2.2, 2.3, 2.4
6.0.7	1.2.5, 2.0, 2.0v2, 2.1, 2.2, 2.3, 2.4
7.0	2.1, 2.2, 2.3, 2.4
7.0.1	2.1, 2.2, 2.3, 2.4
7.1	2.1, 2.2, 2.3, 2.4
7.5	2.1, 2.2, 2.3, 2.4
7.5.1	2.1, 2.2, 2.3, 2.4
7.5.2	2.1, 2.2, 2.3, 2.4

Notes

- System 7.0 or later is required for any stacks using Color Paint Tools or QuickTime 3.
- System 7.1 or later is required for any stacks using AppleScript, HyperCard Button Tasks or the Standalone Application builder.

Macintosh: External Floppy Drive Connector Pinouts

What are the pinouts for the External Disk Drive Connector?
This article has been archived and is no longer updated by Apple.

The external floppy disk drive connector is featured on the Macintosh 128K, 512K, 512K enhanced, Plus, SE, SE/30, Classic, Classic II, IIcx, IIci, IIsi, Portable, and Performa 200.

A Macintosh 400K External Drive can be connected to the Macintosh 128K, 512K, 512K enhanced, Plus, SE, and Portable.

A Macintosh 800K External Drive or an Apple 3.5 Drive can be connected to the Macintosh 512K enhanced, Plus, SE, SE/30, Classic, Classic II, IIcx, IIci, IIsi, and Performa 200.

An Apple SuperDrive can be connected to the Macintosh SE (with SuperDrive upgrade), SE/30, Classic, Classic II, IIcx, IIci, IIsi, and Performa 200

An Apple Hard Disk 20 can be connected to a Macintosh 512K, 512K enhanced, Plus, and SE.

Connector type: DB-19.

Macintosh LC: Upgraded VRAM Improves Monitor Color Depth

Will you explain the advantages of increasing the VRAM on Macintosh LC from 256K to 512K?

This article has been archived and is no longer updated by Apple.
The advantage of increasing the VRAM on the Macintosh LC is an improvement in the color depth.

Here's a chart that shows the improved color depth:

Monitor	With 256K VRAM	With 512K VRAM
Macintosh 12" RGB Display	256 colors/grays	32,768 colors
AppleColor Hi-Res RGB Monitor	16 colors/grays	256 colors/grays
Apple Hi-Res Monochrome Monitor	16 shades of gray	256 shades of gray

Pers LaserWriter LS: Minimal Gain From Memory Upgrade (11/94)

I recently had the RAM in my Personal LaserWriter LS upgraded from 512K to 1MB, and I haven't noticed any performance improvement. When I added RAM to my Texas Instruments MicroLaser printer, there was a definite performance improvement.

What does the RAM upgrade do for the Personal LaserWriter LS?

This article has been archived and is no longer updated by Apple.
Upgrading the Personal LaserWriter LS RAM does not provide a quantum improvement in performance because there is no processing capability on the printer I/O board, this is all handled by the computer to which the printer is connected.

The Personal LaserWriter LS I/O board only unbands the image as it is sent from the computer. Adding more RAM allows the printer to accept slightly larger documents.

A better way to improve Personal LaserWriter LS performance is to add RAM to or increase the performance of the computer to which the printer is connected.

A/UX 3.0: Installer Update Feature

This article explains the A/UX 3.0 Installer update feature.

This article has been archived and is no longer updated by Apple.
With A/UX 3.0, you can do an automatic update of A/UX from version 2.0 or version 2.0.1 if your disk has a minimum of 30MB of free space, and if your partitioning scheme matches that of A/UX 3.0. The free space accommodates the increased size of the A/UX file systems. If your system doesn't meet these two criteria, then we offer two updating utilities. These are similar to the utilities provided with earlier versions of A/UX to find files that need updating and to help you back up those files. Then when you install A/UX 3.0, it repartitions your disk and copies back your system and user files.

The A/UX 3.0 Installer updates existing A/UX 2.0 and 2.0.1 installations to 3.0 in the same manner as the installer used in A/UX 2.0.1. Basically, if the target disk is already set up for A/UX, it skips the disk formatting stage. During the UNIX package installation, outdated 2.x files are REPLACED by their newer 3.0 counterparts. The sizes of these replaced files are used in the free space calculation so that an enormous amount of free space isn't required.

As always, the installer IS NOT a substitute for backing up your disk drive. Make a habit of backing up daily or weekly to ensure the protection of your user files, and any changes you make to the system software.

In addition, A/UX 3.0 continues to support the Autorecovery feature. This feature allows you to recover key system files and get the A/UX computer back into a stable state.

Macintosh LC: No NTSC Video-Out with Apple IIe Card

I have a Macintosh LC with an Apple IIe Card. My problem is that the Macintosh LC doesn't have any composite video-out equivalent to the Apple IIGS and Apple IIe systems that I need for projection.

Do you know of any RGB-to-NTSC converters for the Macintosh LC in Apple IIe mode?

This article has been archived and is no longer updated by Apple.
There is no way to have NTSC-out on a Macintosh LC if an Apple IIe Card is installed. RasterOps, Truevision, or the Computer Video RGB-to-NTSC converters won't work because they require an RGB signal with NTSC timing. The Macintosh LC doesn't have this kind of video port (that is, it doesn't have NTSC sync timing rate built into the board).

Here are two workarounds:

* Use an Apple IIe or Apple IIGS as your NTSC projection system.

* Use an LCD overhead projection panel compatible with the Macintosh LC. Any panel compatible with the 12-inch monochrome or 13-inch RGB monitor will work with the Macintosh LC video port. This solution has the advantage of being a Macintosh environment projection device. We are unaware of any LCD projection panels compatible with the 12-inch RGB monitor.

Another option is using a video card such as the Spectrum/8 LC Card. You have used the slot, but now have a video board that supports not only large screen monitors, but also supports video-out with the addition of the RasterOps video expander or the Computer Video NTSC encoder. It gives you 256-color graphics for the Macintosh LC. This still doesn't allow for both the Apple IIe card and NTSC video-out.

The Spectrum/8 LC Card supports the following displays:

- SuperMac 19-inch Platinum Display
- 21-inch Platinum Two Page Display
- 16-inch Trinitron Display
- 19-inch Dual-Mode Trinitron Display
- 19-inch SuperMatch Color Display
- 21-inch SuperMatch Two Page Color Display
- Apple 12-inch RGB
- Apple Color 13-inch
- Apple Macintosh Portrait Display
- Apple 21-inch Monochrome
- RasterOps 19-inch
- Radius 19-inch (1152 x 882)

MacX: Compile Font from BDF File to Make It Usable

We're using MacX with AIX on an RS6000. Our environment includes NDC X Terminals and PCs running X-Vision from VisionWare. We use WordPerfect on the RS6000.

Some of the fonts are causing problems. In particular, MacX erroneously interprets lines as bogus characters. Here is an example of a font description:

bld17.500.snf -ibm--bold-r-block--23-16-100-100-m-110-ibm-pc850

Does Apple have anything that corresponds to these fonts? How do we map in to them?

This article has been archived and is no longer updated by Apple.
Apparently, the MacX client is requesting a font that doesn't exist in the MacX server.

We suggest the following:

- Use software called "snftobdf" to convert an SNF (Server Natural Format) file into a BDF (Bitmap Distributed Format) file.

- After converting the file to Bitmap Distributed Format, compile it by Font Directory under MacX. It will produce a font in a format the MacX server can use. For more detailed information on how to compile a BDF file within MacX, see page 101 of Apple MacX User's Guide, "Compiling fonts from BDF files."

You must store all available fonts in the MacX Fonts folder, and the MacX Fonts folder must reside either in the System Folder or in the same folder as the MacX application.

MacX 1.1.7: How to Bypass Standard Colormap Initialization

How can I modify the MacX 1.1.7 application with ResEdit to bypass the standard colormap initialization?

This article has been archived and is no longer updated by Apple.
Follow these steps:

1) Back up the golden master of MacX 1.1.7 before doing the change.

2) Open MacX 1.1.7 golden master with ResEdit and open CODE #4 resource.

3) Change the 0x4E56 at 0x2952 offset to be 0x4E75 (RTS instruction). This removes the standard colormap initialization.

Published Date: Feb 18, 2012

MacX: Default Font When Client Software Doesn‘t Specify

What is the default font that MacX uses if the client software doesn't specify a font?

This article has been archived and is no longer updated by Apple.
If the X client application doesn't specify any font to use, the MacX server looks for the "fixed" font. See page 115 of "Apple MacX User's Guide" for details.

Note that even if the X client doesn't specify the font name on the client's command line, the client can still look for some default places in the client host (like .Xdefaults file in user's home directory and the /usr/lib/X11/app-defaults file) for resources. These files store application and machine-specific resources. The details about how the X resources are referenced can be found in most X11 reference documents, such as the one on page 10 of X(1) manual pages in "X11 Reference for A/UX."

Published Date: Feb 18, 2012

A/UX: FMbackup Utility Restores .fs_cache After Crash (5/97)

This article describes the FMbackup utility you can use with A/UX.

This article has been archived and is no longer updated by Apple.

FMbackup.sit is a useful utility. It keeps a current backup copy of your .fs_cache (in compressed form) so that after a crash (toolbox or A/UX), it restores the backup copy before you restart the Macintosh. You don't have to manually relocate icons, windows, and so on.

You can find FMbackup.sit posted on A/UX Support Server (aux.support.apple.com). Here is the path:

```
aux.support.apple.com (130.43.6.2)
   /usr/spool/ftp/aux.patches/unsupported/2.0
```

This version of FMbackup utility works under A/UX 2.0.1 and A/UX 3.0, but doesn't work properly under A/UX 2.0. The README file included in the package gives the details.

StyleWriter: Use Driver 7.1 with IIe Card Software 2.0 and 2.0.1

We installed the new StyleWriter drivers and they work great on the Macintosh. However, we can no longer print from an Apple IIe card. We have a Macintosh LC 4/80 running AppleWorks 3.0 on the IIe card. We had no problems printing until we installed our driver update. The computer seems to communicate with the printer, then the computer locks up, and we have to restart.

This article has been archived and is no longer updated by Apple.
If the new StyleWriter drivers are version 7.2 or 7.2.2, the recommendation is to use version 7.1 StyleWriter drivers with the Apple IIe Card software version 2.0 and 2.0.1. The 7.2 and 7.2.2 versions of the StyleWriter drivers haven't been tested with the Apple IIe Card software versions 2.0 and 2.0.1.

ImageWriter & Excel 3.0: Fix for Problem Printing from Finder

I'm having problems printing multiple documents from a Macintosh Classic to an ImageWriter II. I'm using Excel 3.0 . In the Macintosh Reference Guide, on page 123, it tells how to print multiple documents.

After selecting all documents and choosing Print from the File menu, I select the ImageWriter II settings, which are: Faster/ All/ 1 Copy and Automatic. From the Desktop, each document opens, prints, and then closes in the order selected.

After each page, the top margin drops and continues to drop on every page. Also, after the first document prints, a dialog box asks you to insert the next sheet of paper. After clicking OK, the next page prints. The dialog box doesn't come up after every document, and randomly comes up when printing a multiple page document.

I reloaded system software, ImageWriter driver, and Excel 3.0. This doesn't help. I then printed the multiple documents to a LaserWriter II rather than to an ImageWriter II. Each document opened, printed, and closed in the order selected without a problem.

This article has been archived and is no longer updated by Apple.
We called Microsoft Tech Support and found that the same result is to be expected when printing from the Finder to an ImageWriter (or ImageWriter II) from any Macintosh under System 6 or 7.

The problem has been isolated and fixed in Excel version 3.0a. Registered users can call Microsoft Support for Excel on the Macintosh. Tell them that printing from the Finder to an ImageWriter causes problems, and they will send the updated software.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

LW Driver and System SW: Recommended Combinations

This article discusses system software and LaserWriter driver compatibility.
This article has been archived and is no longer updated by Apple.
On the early Macintosh computers (128K and 512K), Apple Computer recommends using the LaserWriter driver 5.2 with System 3.2 and Finder 5.3.

On later Macintosh computers, Apple recommends the combinations of system software and LaserWriter driver indicated in the table with YES.

Items marked with an 'X' indicate that the combinations are compatible. However, you should use the recommended combinations.

System Software							
LW Driver	Driver Notes	Pre 6.0.7	6.0.7	6.0.8	7.0.x	7.1.x	7.5.x
6.0.2		YES	X	X			
7.1.x			YES	X			
7.2				YES	X	X	X
8.0						X	
8.1.x			X	YES	X	X	X
8.2	5					X	X
8.2.2						X	X
8.2.3f					X	X	X
8.3	6,7				YES (3)	YES	YES
8.3.4							X
8.4	6,8				YES (3)	YES	YES
8.4.3						X	X
8.5.1						X	X
8.6							
Software Notes			10	2		4	

This table is currently being revised, please check back later.

System Software							
LW Driver	Driver Notes	7.6	7.6.1	8.0	8.1	8.5	8.5.1
6.0.2							
7.1.x							
7.2

8.3		X	X	X	X		
8.3.4		X	X	X	X		
8.4							
8.4.3		X	X	X	X		
8.5.1		X	X	X	X	YES	
8.6			X		X	YES	X
Software Notes							

Notes	Description
1	The LaserWriter 8.1.2 driver was the last version of the LaserWriter 8.x driver tested with any version of System 6.x. |
2	System 6.0.8 should use the LaserWriter 7.2 or 8.1.2 driver.

3	System 7.0.x should use the LaserWriter 8.3.4 or LaserWriter 8.4 driver WITHOUT the Desktop Printing extension.
4	Desktop Printing requires System 7.1 or greater.
5	LaserWriter 8.2 requires System 7.0 or greater.
6	LaserWriter 8.3 and greater with Desktop Printing requires System 7.1 or greater.
7	LaserWriter 8.3.4 can be found on Apple SW Updates and resolves the PCI Macintosh printing problem.
8	LaserWriter 8.4 is available on Apple SW Updates. It has many new features. If you have problems using the LaserWriter 8.4 driver.
9	LaserWriter 7.2 seems to work properly on newer version of the Mac OS, such as System 7.5.3. Although Apple has not received reports of incompatibilities, LaserWriter 7.2 was not tested with recent versions of Mac OS.
10	Apple recommends that customers who want to continue using System 6.0.x, upgrade to System 6.0.8.

NetWare for Macintosh VAP 1.1: Phase 1/2 Conflict & Workaround

I have a 386 server running NetWare 2.15c and NetWare for Macintosh VAP v1.1 on an Ethernet network. The Ethercard in the file server is a Western Digital Star/Ethercard Plus (with AppleTalk) v3.07. There is also a Dayna AppleTalk PC card v1.22 to support a LaserWriter NT for the network. A Macintosh LC connects to the network with an Apple Ethernet card.

I have installed the VAP program three times and still can't get the LaserWriter or the file server to show up in the Macintosh Chooser. I'm running the driver for Phase II on the Macintosh LC.

I know that the Ethernet connection is good, because I also have Insignia Solutions SoftPC Universal v2.5 and SoftNode v1.0 running on the Macintosh LC. I can access the file server and run all the loaded applications (DOS and Netbios).

This article has been archived and is no longer updated by Apple.
You most likely have an AppleTalk Phase 1 versus Phase 2 conflict. The NetWare for Macintosh VAP 1.1 only supports Phase 1. This prevents any Phase 2 client from using the services.

Novell recommended a workaround. Upgrade to NetWare 2.2, and to the Macintosh VAP version 2.2. This will provide the NetWare server with AppleTalk Phase 2, and allow it to publish a LaserWriter printer queue that Macintosh clients can use.

Published Date: Feb 18, 2012

MacX: Problem with Ultrix Xlib Library

I have a problem using MacX 1.1.7 and Ultrix dxcalendar. The DECwindow client Calendar on Ultrix hangs when using the client EDIT menu. The problem produces the error message:

Xlib: sequence lost (0x108b9 > 0x8ba) in reply type 0x1c!

This problem doesn't occur when using Calendar for the first time. Once I make a calendar entry, I see the problem. It works fine with White Pine's eXodus or with an NCD16 X Terminal.

Configuration:

- Macintosh IIci
- 8MB memory
- 13-inch Apple High Resolution RGB
- Built-in video card
- Ethernet Controller type 3Com Ethernet card, Revision L
- System software version 7.0
- MacX 1.1.7

This article has been archived and is no longer updated by Apple.
This is a known bug in the Ultrix version of the Xlib library which applications use to get access to the X protocol. It exists in Ultrix 4.0 and 4.1 and possibly later versions as well. This ISN'T a MacX bug; it happens under similar circumstances with Sun and other 68K-based X servers. MacX seems to have the problem more often than other servers due to the built-in conversion of the Clipboard to Macintosh Clipboard; this aggravates the problem.

This article has been archived and is no longer updated by Apple.

-- Power for a modem overseas

This is not a problem. Buy a grounded isolation transformer in the country of use, plug the modem's wall outlet transformer into this converter, and the modem's power supply regulates the voltage internally. You should thoroughly investigate the voltage and frequency of the power source, however.

-- Different Protocols

A number of overseas countries use the French standard "CCITT" protocol for modem communications. The systems of some countries may not be suitable for clean data transmission or may not allow communication except on specially conditioned lines.

-- Special Laws restricting data communication

German law, for example, requires a permit to use a communications device. You should acquaint yourself with any national, regional, or local laws or conditions on using modems.

PATHWORKS: Problem Escalation Process

I have a PATHWORKS question about problem escalation and the interface to Apple. Since DEC now owns all the code except DAL and MacX, should we just push all escalations up the "normal" DEC path?
This article has been archived and is no longer updated by Apple.
PATHWORKS for Macintosh has always been a Digital product. It's sold and supported by Digital. Report all problems with PATHWORKS-related components to Digital support.

- In the U.S., this is Digital Customer Support Center (CSC).

- From other countries, report problems to the local Digital office; they will escalate to Digital in the U.S. if necessary.

Apple Engineering has trained Digital engineering on the transitioned components. The process for escalation hasn't changed. If Digital CSC can't handle a problem, they will escalate it to the PCSG Engineering Maintenance Organization (PCSGEM). Should that component be something Apple developed and maintained, Digital PCSGEM will notify Apple Tech Comm.

Macintosh: DQDB (Distributed Queue Dual Bus) and MANs

Is a card available for Macintosh computers to connect to Distributed Queue Dual Bus (DQDB) Metropolitan Area Networks (MANs)?
This article has been archived and is no longer updated by Apple.
A MAN data transport mechanism is the intended use of a Distributed Queue Dual Bus (DQDB), and DQDB MANs are meant to function as connectionless networks that link multi-megabit LANs together. Because of this, a Macintosh isn't a likely first candidate end-node device for design and manufacture of DQDB interface cards.

It's more likely that DQDB networks will connect to devices such as routers and bridges. Routers and bridges (interconnect devices) will be the first to have DQDB interfaces, and it may be a year or more before those come into real use. There have been some SMDS/DQDB trials, and Bell Atlantic is presently offering SMDS service to a limited area. Wide use of this technology is still several years away.

If you need to put your Macintosh computers on a MAN today, you can use a router to attach to the MAN and then a LAN (of your choice) to attach to the Macintosh end nodes. There may eventually be an SMDS/DQDB interface for the Macintosh when the service becomes a real commercial product.

Here's some background information on DQDB to help understand what it is.

DQDB Background Information

Metropolitan area networks (MANs) could offer answers to the demand for communications with anyone, anywhere, cheaply and reliably. The ideal answer is a system that can support high speeds and geographical distances of hundreds of kilometers and be available for everyone.

FDDI is a popular backbone technology capable of high-speed communications and allows extended distances between networked sites. Presently FDDI is considered suitable for high-speed workstation networking.

The telephone industry supports a proposed MAN implementation called Queued Packet Synchronous eXchange (QPSX). The IEEE 802.6 committee changed the name to Distributed Queue Dual Bus (DQDB) in order to avoid confusion with an Australian company. MANs have implications that apply to corporate use and to the entertainment industry for advanced video and voice services.

The Distributed Queue Dual Bus (DQDB) standard was adopted as IEEE 802.6 in late 1990. DQDB describes a physical layer and Medium Access Control (MAC) sublayer to support packet and isochronous (time-sensitive) data transport over a metropolitan area. DQDB describes a transport network, not a MAN service.

Bellcore's description of a MAN service is SMDS. As currently specified, SMDS will provide the MAN service using DQDB as the underlying transport network. The first in a series of TAs defining the requirements for SMDS was released in October 1989. These documents include specifications for the user interface, service structures, network components, billing elements, and network management. SMDS TRs started to appear this year, and SMDS demonstrations, trials, industry groups, and related standards have also started to appear. SMDS will be very important in the RBOCs' future deployment plans for MANS, particularly as an initial step to offering Broadband ISDN (B-ISDN) services.

AT&T's competition comes from QPSX Systems of Perth, Australia, which backs Distributed Queue Dual Bus (DQDB). QPSX is a joint venture of Telecom Australia and the University of Western Australia, the developer of DQDB.

Communications industry analysts said there's little difference between AT&T's SMDS and QPSX Systems' DQDB beyond the initials. "SMDS is AT&T's

implementation of DQDB," said Stuart Gavurin, a network analyst at Ernst & Young.

In 1987, IEEE decided to use DQDB as the basis for MANs, and a year later QPSX announced an agreement to allow AT&T to manufacture DQDB-compliant products. Shortly after that, however, AT&T decided to pursue its own implementation of MAN.

Gavurin said that the point for potential users to note is SMDS and DQDB adhere to the 802.6 standard and are compatible with each other. Users can buy products based on one implementation and know the products will work with those based on the other implementation.

Apple Ethernet NB Card: No Option to Disable Link Beat Signal

I want to install a new Apple NuBus Card, but I have two types of HP hubs. The newer one supports Link Beat and the old one requires Link Beat to be off.

If a hub requires Link Beat to be off, does the Apple NuBus card or software have a way to turn it off? I've heard of third-party cards that have jumpers on the cards to do this.

This article has been archived and is no longer updated by Apple.
The new Ethernet NB card doesn't have options to enable or disable the Link Beat signal. Some early twisted pair Ethernet hubs didn't use Link Beat and can't function with transceivers that use it. It's true that some third-party cards have the option to disable this signal. They're trying to be compatible with all hubs (pre- and post-10baseT). Apple designed the cards to be compatible with the true 10baseT specification, which requires Link Beat.

AppleTalk and IBM 8209 Bridges Don‘t Mix

I have a lab with 24 Macintosh LCs and one Macintosh IIci on Ethernet. The file server is attached to an IBM 8209 bridge which is a hardware component that bridges Token Ring networks and Ethernet networks. Some of the Macintosh LC computers randomly won't show the file server in the Chooser, but the Macintosh IIci always shows the file server.

If we restart the IBM 8209 bridge, the Macintosh LCs show the file server again. All the workstations, Macintosh LCs, and Macintosh IIci run system software version 6.0.7. The file server on the other side of the 8209 bridge is a Macintosh IIci running System 7.0 and AppleShare 3.0. We tried System 7.0 on all the computers, and AppleShare 2.0 with system software version 6.0.7 on the server.

This article has been archived and is no longer updated by Apple.
Here is some information that should help you understand why the IBM 8209 bridge and AppleTalk aren't compatible.

IBM 8209 and AppleTalk

Ideally, with the 8209 providing Token Ring to Ethernet bridging services, Macintosh computers on both transports would see the bridged network as a single logical network. Unfortunately, for a number of reasons, this isn't true.

Phase 1 EtherTalk

The first problem stems from the 8209 bridge's generosity in forwarding all datalink (MAC) broadcasts and multicasts. When you run ANY Phase 1 EtherTalk, adding an 8209 bridge into the network automatically generates Phase 1 TokenTalk. This is useless traffic, because the TokenTalk drivers expect Phase 2 protocols. As far as we can tell, it isn't dangerous traffic; it's safely ignored by all nodes. But it does take up bandwidth, and if the Phase 1 Ethernet is large and has many routers, there can be significant broadcast traffic forwarded onto the Token Ring. The answer here is to filter Phase 1 EtherTalk at the 8209 bridge.

Address Bit-Flipping

Token Ring and Ethernet don't agree on the order of bits. So, the 8209 bridge flips the bits of the datalink (MAC) level addresses when it forwards the packets. Normally, this affects only the destination and source addresses in the packet header. However, address resolution protocols such as TCP/IP ARP and AppleTalk's AARP also carry MAC level addresses as a part of the data portion of the packet. The 8209 bridge is specially programmed to look for TCP's ARP, and to go down inside the data, flipping the bits of the embedded MAC address. Later, when a Token Ring host wants to talk with an Ethernet node, it uses the flipped version of the MAC address. When encountered by the 8209 bridge, the address is flipped back and thus delivered correctly.

The 8209 bridge ISN'T specially programmed to assist AARP. Thus, the AARP address is stored in the Token Ring AppleTalk node in its "unflipped" form. Then, should it be used later to address a packet, the 8209 bridge will flip the bits when forwarding back to Ethernet. Now the packet is incorrectly addressed, and can't be delivered.

In short, when using an IBM 8209 to bridge Token Ring and Ethernet, AppleTalk nodes on the ring and Ethernet can't communicate because they can never use AARP correctly.

Configuration Workarounds

Curiously, if the you use Token Ring only as a backbone, and a Macintosh on Ethernet wants to talk to a Macintosh on another Ethernet, with both Ethernets attached by 8209 bridges, this connection WILL work. In fact, as long as you go through an EVEN number of 8209 bridges, connection succeeds. When there's an odd number, connection fails. Note that this makes some extremely bizarre network configurations possible, such as a system of alternating Token Rings and Ethernets connected by 8209 bridges. In this case, all the Ethernets would have AppleTalk connectivity, and all the Token Rings would have AppleTalk connectivity, but the rings and Ethernets would have AppleTalk connectivity between them!

Address Ranges

You may remember that under AppleTalk Phase 2, we use multicast addressing for all protocol "overhead" packets, such as RTMPs, NBPs, and ZIPs. You may also recall that we have a range of 254 addresses used in Ethernet, and 19 different addresses in Token Ring available for multicasts.

Our use of different address ranges, in addition to the bit flipping described previously, ensures that AppleTalk nodes can't interoperate across an 8209 bridging Ethernet and Token Ring. Just look at the startup process.

A node begins by sending an AARP probe for a protocol address (multicast). The 8209 bridge forwards this AARP message, but because the bits are flipped, a response to the AARP probe gets lost on the return trip. So, the node assumes that its protocol address is unique, and then proceeds to check for a router by multicasting (protocol broadcasting) a ZIP GetNetInfo request. If there is an AppleTalk router present on the cable (whether on Ethernet or Token Ring), it will work. The router hears the request, provides the needed information about the cable, and sends another AARP if necessary.

However, if the router is on the other side of the 8209 bridge, the multicast is forwarded. Even if the bit-flipping wasn't a problem (that is, if IBM were to change the 8209 software to support AARP), you will still NOT MAKE CONNECTION with the router. This is because a TokenTalk router expects multicast addresses in a different range than an EtherTalk node can send, and vice versa. The only answer is to use an AppleTalk router, which manages protocol and zone multicast addresses for each data link appropriately.

In short, AppleTalk and 8209 bridges don't mix. We advise you NOT to use bridging strategies between AppleTalk Token Ring and Ethernet networks.

Network Monitoring: Tools that Identify Missing Zones

We use Inter*Poll to get a list of all our AppleTalk zones on the network. We printed a list, generated another list, and we found that two zones were missing. Is there a utility available that will check the network, and give us a complete list, including the zones that are down?

This article has been archived and is no longer updated by Apple.

If you want an automated network monitoring tool that specifically looks for zones that are missing or have been added without authorization, here are two applications that might help you:

- Network Vital Signs, from Dayna Communications

- NetWatchman, from Neon Software

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

Macintosh: RPC-Based Tools

We developed an RPC implementation for OS/2, and would like the same functionality on the Macintosh. Is there an equivalent product for the Macintosh operating system?

This article has been archived and is no longer updated by Apple.
Netwise offers the only RPC-based tools we're aware of for the Macintosh operating system. Netwise has developed some RPC monitors and end-user applications based on RPC for the PC market, but it offers only a developers' toolkit for the Macintosh.

Also, IPT developed a peer-to-peer (Macintosh to Sun) network communications application that maintains the native user environments on both platforms.

Netwise RPC TOOL

The Netwise RPC TOOL for Macintosh computers on TCP/IP networks provides remote procedure call technology for Apple platforms. The RPC TOOL allows developers to build client/server applications for a wide variety of hardware, operating systems, and network transport environments. RPC TOOL for Macintosh supports Macintosh System 6.0 or later, and Symantec Corporation's C development environment, THINK C, version 4.0.

The Macintosh RPC TOOL allows Macintosh applications to interoperate across a TCP/IP network with applications running on diverse systems, including DEC VAX computers running VMS and ULTRIX, PCs running DOS and OS/2, Sun workstations, Unisys, Hewlett-Packard, and Data General hardware, and many other systems running UNIX variations.

Information Presentation Technologies Sun-Partner

Sun-Partner symmetrically maps network protocols and operating system commands between graphical user interfaces. Sun SPARCstations look like Macintosh computers to Macintosh users, and Macintosh computers look like Sun workstations in the OpenLook or SunView environments. Users can share and exchange data from their own user interfaces. All networked devices are available simultaneously to Sun and Macintosh users.

Sun-Partner supports LocalTalk, EtherTalk Phases 1 and 2, AppleTalk Filing Protocols, and the Apple Data Stream Protocol (ADSP) for Macintosh computers and TCP/IP ARP, RARP, and NFS protocols for Sun SPARCstations.

Each SPARCstation on a SunPartner LAN must have version 4.1 or later of Sun's operating system and an Ethernet-to-LocalTalk connection to run on Ethernet, or an sBus LocalTalk card from IPT to run on LocalTalk. An optional sBus LocalTalk card is available. Without Macintosh System 7.0, each Macintosh on a Sun-Partner network requires IPT's Personal Server Network (PSN) software. A Sun and a Macintosh connection are required for bidirectional networking.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

Applesoft: Using the monitor MOVE Routine

This article has been archived and is no longer updated by Apple.

The MOVE subroutine in the monitor will not work directly from an Applesoft CALL because Applesoft doesn't assure the presence of a zero in the 6502's Y register and the MOVE subroutine must have the zero there to work. Here is a program that shows a way around this problem:

```
10 DEF FN M(X) = X - INT (X/256) * 256
20 POKE 768,160 (LDY #0 )
30 POKE 769,0
40 POKE 770,76 (JMP MOVE)
50 POKE 771,44
60 POKE 772,254
100 REM DO THE MOVE
110 START = 20000 Start of memory to be moved
120 QUIT = 21000 End of memory to be moved
130 DEST = 30000 Start of destination
140 POKE 60,FN M(START)
150 POKE 61,START / 256
160 POKE 62,FN M(QUIT)
170 POKE 63,END / 256
180 POKE 66,FN M(DEST)
190 POKE 67,DEST / 256
200 CALL 768
```

TA48082_AUX_Glossary_of_Terms__(TIL09707).pdf

A/UX: Glossary of Terms (8/94)

This document contains an edited version of the September 1989 A/UX Glossary.

This article has been archived and is no longer updated by Apple.

/usr/group. An organization of UNIX users.

/usr/tmp. The /usr subdirectory that serves as storage for temporary files that many utilities produce.

AIX. Advanced Interactive Executive; IBM's UNIX operating system.

Archer Group. The former name of UNIX International (AT&T-aligned companies).

autoconfiguration. A/UX capability to automatically configure the smallest possible kernel by checking for installed NuBus cards.

autorecovery. A/UX capability to reinstall critical system files from duplicate copies on disk. in the event of a system corruption. This is unique to Apple.

B-Net. UNISOFT's port of Berkeley Networking Services; BSD software to provide TCP/IP communication.

background processing. The ability to run programs in the background (behind the scenes) while freeing the display screen for other tasks.

Berkeley Networking Services. B-Net; a utility to provide TCP/IP communication.

binary file. Any executable file.

Bourne shell. The command shell that Steven Bourne developed at AT&T.

BSD. Berkeley Software Distribution, the University of California (Berkeley) version of UNIX. The most common versions are 4.2 and 4.3.

C. A high-level language with few hardware dependencies; ?he UNIX operating system is written in C.

C Shell. The command interpreter developed by U.C. Berkeley programmers

CASE. Computer-aided software engineering.

commands. See Utilities or command name

DECWindows. DEC's proprietary windowing system; the programming interface for DECwindows is incorporated in OSF's standard windowing system. It is based on X Window System from MIT.

directory. A collection of subdirectories and files; a Macintosh folder.

Federal Information Processing. The U.S. federal government's standard for computer purchases; FIPS 151 is based on IEEE's POSIX 1003.1 standard (currently based on Draft 12, Standard (FIPS) of POSIX 1003.1).

FIPS. See Federal Information Processing Standard.

GOSIP. The U.S. federal government's version of the OSI standard.

HFX. Hierarchical File Exchange; a file-translation utility to transport files between A/UX and Macintosh file systems, so users can work in either

environment and transfer information

IEEE. See Institute of Electrical and Electronic Engineers

IEEE POSIX 1003. IEEE's standard for development of vendor-independent applications.

Inside Macintosh. A series of Apple documents that define standards for Macintosh application programming.

Institute of Electrical and Electronic Engineers. The organization that (among other things) creates POSIX standards.

kernel. That portion of the operating system that communicates directly with the hardware to allocate software and hardware resources.

korn shell. A revised command interface that contains features of its two predecessors, the Bourne and C shells for AT&T and Berkeley, respectively

man page. A reference manual page, available on-line with most UNIX systems.

MOTIF. OSF's windowing system. A hybrid of Microsoft's Presentation Manager, HP's New Wave, and DECwindows; It is built on the X Window System from MIT.

multitasking. The ability of a CPU to perform multiple tasks simultaneously by rapidly switching among them.

multiuser. The capability that lets more than one user at a time use the computer.

netnews. The global UNIX user bulletin board with over 500 interest groups and over 8000 recipient systems. It also includes an electronic forum for stating opinions, sharing ideas, requesting, receiving, and providing information, and posting public-domain software

Network File System (NFS). The defacto standard from Sun Microsystems for transparent file sharing. This facility enables a user on one vendor's computer to access files on another vendor's computer.

New Wave. The HP windowing system. Portions of New Wave are incorporated in OSF's standard windowing system

NFS. See Network File System

Open Software Foundation (OSF). A standard-development consortium of companies including DEC, Hewlett-Packard (Apollo), and IBM. It grew out of the so-called "Hamilton Group."

OSF1. OSF's UNIX operating system, based on IBM's AIX operating system

operating system. Software that manages a system's resources -- such as CPU, memory, I/O, disk storage, and networks.

OSF. See Open Software Foundation

OSI. A networking standard. OSI is an emerging set of communications protocols (an alternative to TCP/IP) primarily of interest to Europe and the U.S. Federal Government.

pipe. A feature of UNIX command shells that lets tools (known as filters) to be chained together to create new utilities. Piping causes the output of the first command to become the input of the second.

portability. The ability of software to move from one environment with a particular computer and operating system to another environment; transferability from one computer to another. There are two kinds: Source-level portability requires recompilation. Object-level portability requires only moving the file to the new machine.

POSIX. A set of standards formulated by IEEE as guidelines to allow for development of vendor-independent applications. POSIX 1003.1 defines the UNIX-based operating system interface standard.

Presentation Manager. Microsoft's windowing system. Its human interface constructs have been incorporated in OSF's MOTIF standard windowing system.

SASH. Stand Alone Shell of A/UX; A Macintosh application that shuts down the Macintosh OS to start A/UX. It also allows limited access to A/UX files without starting A/UX.

SCCS. See Source Code Control System.

Serial Line/Internet Protocol (SL/IP). A communications protocol that provides features of TCP/IP over slower, longer distance serial lines. Capabilities like NFS and Telnet Virtual Terminal are available over SL/IP.

shell. A specialized UNIX utility that serves as a character oriented, command-line user interface. C, Bourne, and Korn are three shells available with A/UX.

shellscript. A file containing a list of commands to be executed sequentially; a batch file.

Single-tasking. Allowing only one operation at a time. Contrast with multitasking.

single-user. Allowing only one person at a time to use the computer. Contrast with multiuser.

SL/IP. See Serial Line/Internet Protocol

Source Code Control System (SCCS). A utility developed to control versions of software source code, so they can be safely accessed by multiple programmers and writers on a large project.

superuser. System administrator on a UNIX system who has special privileges like changing file permissions, reassigning its ownership, or deleting.

SVID. See System V Interface Definition

SVVS. See System V Verification Suites

System V Interface Definition (SVID). The AT&T standard that defines core elements of the System V operating system. SVID-1 describes AT&T V.2, and SVID-2 describes AT&T V.3.

System V Verification Suites (SVVS). AT&T software that runs on a UNIX system to test whether that system meets the SVID. SVVS 1 and 2 correspond to and test for compliance with SVID 1 and 2 and V.2 and V.3, respectively.

TCP/IP. See Transmission Control Protocol/Internet Protocol.

Transfer Control Protocol/Internet Protocol (TCP/IP). A communications protocol and defacto standard protocol for Ethernet networks used by most UNIX environments. TCP/IP is typically the underlying protocol with NFS, Telnet, and X Window System.

Trusted systems. The U.S. federal government's graded approach to

security standards. Also known as "Orange Book." It defines a series of levels of Trust. C1 to A1 where C2 will be the basic requirement for government security in the near future, B1 is a greater level of security and is expected to be the level typically requested for secure government bids.

UI. See UNIX International.

UNIX International (UI). A consortium of companies that follow the AT&T standard for UNIX systems. Originally created to counteract OSF's efforts (previously called Archer group)

usenet. Global Unix mail service sponsored by various universities and large corporations. It tends to be the primary method for UNIX users to share information.

utility. A program that does most operating services, like listing, copying, renaming, and removing files.

uucp. The UNIX to UNIX Copy command is a utility that enables file transfers between UNIX systems and allows automatic transmission of mail messages.

X Window System Consortium. A group originated by MIT that defines X Window System standards for future versions. Apple is a member.

X Window System. A device-independent multitasking environment, originally designed by MIT, for windowing and graphics. It operates across heterogeneous networks.

X/OPEN Standards Committee. A group begun in Europe that sets standards for UNIX and related tools. It focuses primarily on user needs and includes UI and OSF in its membership.

Yellow Pages. A distributed network database service that makes available to workstations copies of files maintained on the server. Usually used in conjunction with NFS. Licensed and developed by Sun Microsystems

MacX 1.1: Using with System 7.0.x (6/94)

Can I run MacX 1.1 under the Macintosh System Software 7.0.x?
This article has been archived and is no longer updated by Apple.
MacX 1.1 is designed for use with Macintosh System software version 6.0.x. You can also use MacX 1.1 with System 7.0.x with limitations, by following the steps in this document. (You do not need to perform these procedures if you want to use MacX 1.1 on System software version 6.0.x.)

IMPORTANT: MacX version 1.1.7 is compatible with System 7.0.x, and MacX version 1.2 is compatible with System 7.1.x. It is recommended to upgrade MacX.

If you're using MacTCP to connect your Macintosh computer to a host computer, you can use MacX 1.1 with System 7.0.x by following several setup procedures. These procedures describe several guidelines that let you use MacTCP version 1.0.2 with System 7.0.x.

Note: If you're using a connection tool other than MacTCP, the instructions in this document don't apply. For more information, contact the vendor of your connection tool.

To use MacX 1.1 with System 7.0.x, install MacX 1.1 and MacTCP 1.0.2 on your computer and then follow the instructions below.

1) Don't use Virtual Memory under System 7.0.x. Open the Memory Control Panel and make sure Virtual Memory is turned off.

2) Connect via Ethernet with MacTCP. For Token Ring access you must use MacTCP 1.1 or later with the MacTCP Token Ring extension.

3) Open the MacTCP control panel to make sure that the Ethernet icon is present and selected. (You cannot use a DDP/IP gateway via EtherTalk, LocalTalk, or TokenTalk.)

4) Make sure the MacTCP control panel, the AdminTCP control panel, and the Hosts files are in your System Folder and NOT in the Control Panels folder.

To copy these files to your System Folder, drag the icons for the three files to the open System Folder window. Do not drag the icons to the System Folder icon; the Finder will put them in the wrong place.

5) Restart your Macintosh computer to put these changes into effect.

You are now ready to use MacX 1.1 on your Macintosh computer running System 7.0.x. You may want to store this document in your MacX binder for quick reference.

Note: MacTCP 1.0.2 is not fully compatible with System 7.0.x. Apple Computer, Inc. does not therefore guarantee 100 percent compatibility and functionality.
Published Date: Feb 18, 2012

MacX 1.1.7: Needed for System 7, Not for A/UX

I use both System 7 and A/UX. Do I need to update to MacX 1.1.7?

This article has been archived and is no longer updated by Apple.
If you are running MacX with A/UX, you do not need to upgrade to MacX 1.1.7. MacX has been included in A/UX since version 2.0.1 (March 1991). The next version of A/UX, which will include support for System 7, will incorporate MacX 1.1.7.

MacX 1.1.7 is the latest version of Apple's X Window System display server for the Macintosh operating system. It provides X Window System access and functionality for Macintosh computers in multivendor environments. MacX 1.1.7 provides an integrated computing environment with simultaneous access to Macintosh and X applications and the ability to cut and paste color graphics and text between them.

MacX 1.1.7 provides support for System 7. MacX users can take advantage of System 7 functionality, like Virtual Memory. This new capability expands the computer's memory through software, so that Macintosh users can run more and larger applications. MacX 1.1.7 is required for running MacX with System 7.

In addition, X11 for A/UX, Apple's complete X development environment replaces X Window System for A/UX, which used to incorporate MacX. You can use this product, which includes client applications, libraries, and tools for X Window System development. X11 for A/UX includes the software on both floppy disks and CD-ROM discs.

Published Date: Feb 18, 2012

MacX25 1.0.1: Overview

What is the latest version of MacX25, and what are its features?
This article has been archived and is no longer updated by Apple.
MacX25 version 1.0.1 is updated software for linking Macintosh computers to packet-switched data networks (PSDN) supporting the international OSI and CCITT X.25 recommendation for enterprise-wide communication.

Apple's MacX25 1.0.1 runs on Macintosh computers running System 6 or System 7, supporting any Macintosh as an X.25 client and all Macintosh II computers as servers. System 7 offers a range of services for networking, including file sharing and interapplication communication. To ease your transition to using X.25 in the newer system software environment, MacX25 version 1.0.1 retains the same set-up configuration and does not alter the interface used in MacX25 version 1.0. Access to host computers and end-user services on the PSDN is distributed from a MacX25 server to Macintosh computers over the AppleTalk network system.

For improved communication with European networks, MacPAD (the client side of MacX25) now supports 8-bit characters. Support for 8-bit characters -- in which such symbols as the German umlaut, French cedilla, and Spanish tilde are encoded -- enables businesses on both sides of the Atlantic to transfer data files transparently and to communicate in the appropriate European languages.

The new MacPAD also offers new features for flexibility in communicating across the X.25 network, including the ability to negotiate throughput parameters and the size of packet windows. In addition, because it is implemented as a connection tool for the Communications Toolbox, MacPAD lets third-party applications, including terminal emulators, connect to host systems over the X.25 networks.

The MacX25 Programming Library, available separately for third-party developers, works in conjunction with the MacX25 server to provide X.25 access to applications. This enables developers to create Macintosh solutions giving users access to PSDNs. The library, which remains unchanged in the new version of MacX25, consists of a toolkit for such routines as initiating and terminating contact with the MacX25 server, establishing and closing down a virtual circuit, and passing data across an established circuit.

For example, an application developed in Italy uses tools in the MacX25 Programming Library to provide Macintosh-to-host access across an X.25 network. List SpA developed a cost-effective interbank trading network for the Italian banking system that enables Macintosh computers in each bank to connect to the system's mainframe over the X.25 network.

Apple's MacX25 conforms to the Open Systems Interconnect (OSI) model and Consultative Committee on International Telephone and Telegraph's (CCITT) X.25 recommendation for communication with packet-switched data networks (PSDN). Because of their cost-effective use of leased lines to transmit information over long distances, X.25 PSDNs offer an increasingly popular means for electronic communication internationally.

MacX25 consists of server and client software. The MacX25 server software lets a Macintosh on an AppleTalk network be set up as a single entry point to the PSDN. Server-based access reduces the cost of global connectivity by maximizing use of expensive resources, like leased lines. MacPAD client software works in conjunction with the server software to provide packet assembler/disassembler connectivity to the PSDN.

MacX25 features a graphics-based administrator's application that facilitates configuration and administration of the server. An address service lets administrators set addressing details on the Macintosh server.

Running the server component of MacX25 1.0.1 under System 7 requires 4MB of RAM; the client side needs 2MB. To run MacX25 1.0.1 server software with System 6.0.7 requires 2MB of RAM; the client side needs 1MB.

MacX25 supports the following standards and recommendations: CCITT X.25 1980 and 1984 versions and Packet Assembler/Disassembler (CCITT X.3, X.28 and X.29).

TA48087_AUX_Purpose_of_X_Windows__(TIL09713).pdf

A/UX: Purpose of X Windows (9/94)

Who would purchase X window system for A/UX?

This article has been archived and is no longer updated by Apple.
People who want to run the X11 native environment on a Macintosh or need to develop X Window System applications should use X Window System for A/UX. It includes X11 Release 4 with libraries, toolkits, and clients for development.

If you need access to X Window System applications, you do not need to purchase X Window System for A/UX. A/UX 3.0 includes MacX and the X Window System display server software.

TA48088_AUX_Compatibility_with_Macintosh_Applications_(TIL09715).pdf

A/UX 2.0.1: Compatibility with Macintosh Applications

Which Macintosh applications run on A/UX?

This article has been archived and is no longer updated by Apple.

With A/UX, users have access to the wide range of Macintosh applications available at local dealers -- the same application binaries that run on the Macintosh OS. There is only one restriction: Applications must follow the "Inside Macintosh" development guidelines for 32-bit cleanliness.

This is also a requirement for applications that run with virtual memory on Macintosh System 7. All key industry software developers are moving in this direction. Many already offer mainstream applications which are 32-bit clean and thus run on A/UX 2.0.1. This group includes Microsoft, Claris, Aldus, and Informix. A complete list of applications is included in the A/UX Third Party List on AppleLink under the A/UX icon.

As a transitional step, A/UX 2.0.1 also includes a 24-bit environment which allows users to run many applications which are not yet 32-bit clean.

All applications that run on A/UX 2.0 also run on A/UX 2.0.1. The applications categories include Macintosh, UNIX, X Window System, Motif (from Integrated Computer Solutions) and MS-DOS applications (using SoftPC from Insignia Solutions).

TA48089_AUX_Compatible_UNIX_Applications__(TIL09716).pdf

A/UX: Compatible UNIX Applications (9/94)

Which UNIX applications run on A/UX?

This article has been archived and is no longer updated by Apple.
The UNIX application community has expressed a lot of interest in porting UNIX and X Window System applications to A/UX and for new development work. A good example is Oracle; they have ported their UNIX database to A/UX and have provided Macintosh tools to access this data easily.

Many UNIX development tools have also been ported to A/UX. Refer to the Redgate Library on AppleLink for a list of compatible third party products. In addition, many of our largest A/UX customers are asking these application developers to support A/UX.

AppleTalk Remote Access: AppleEvents Support

What AppleEvents does the Remote Access application support? I'm looking for a capability to request a connect and/or disconnect from the AppleTalk Remote Access application via AppleEvents.
This article has been archived and is no longer updated by Apple.
Remote Access supports only the AppleEvents from the required suite:

- Open Application
- Open Document
- Quit Application

It doesn't support Print Document because AppleTalk Remote Access doesn't have a print option.

After installing AppleTalk Remote Access, if you launch Remote Access without configuring Remote Access Setup, a dialog box appears asking if you would like to do so. At that point, AppleTalk Remote Access sends the Finder an "Open" Remote Access Setup AppleEvent.

As an alternative, you may want to use the AppleTalk Remote Access Application Programming Interface (API). It would be possible to have your application access the API directly, or to have your application send an AppleEvent to a program that accesses the API directly.

Details of the API external reference specifications are available from APDA in the AppleTalk Remote Access Developer's Toolkit. Part number R0128LL/A.

Macintosh 16" Color Display: Compatibility and Bit Depth Info

This article provides compatibility and bit depth information for the Macintosh 16" Color Display when used with Macintosh computers and Apple's video cards.

This article has been archived and is no longer updated by Apple.

Model	Card	Bit Depth
Macintosh IIci	On-board Video	Not Compatible
Macintosh IIsi	On-board Video	Not Compatible
Macintosh LC	On-board Video	Not Compatible
Macintosh II Series	Macintosh II Video Card	Not Compatible
Macintosh II Series	Macintosh II Hi-Res Video Card	Not Compatible
Macintosh II Series	Macintosh Display Card 4*8	8-bitã
Macintosh II Series	Macintosh Display Card 8*24	8-bitã
Macintosh II Series	Macintosh Display Card 8*24 GC	8-bit*
Macintosh II Series	Macintosh Display Card 8*24 GC (Rev B)	8-bit/16-bit

ã The original Macintosh Display Card 8*24 and Macintosh Display Card 4*8 require a ROM upgrade kit (service part #076-0548). The new ROM (part #341-0868) provides support for the Macintosh 16" Color Display.

** The original Macintosh Display Card 8*24 GC requires a ROM upgrade kit (service part #076-1019). The new ROM (part #341-0266) provides support for the Macintosh 16" Color Display.

Note: All current Finished Goods for the Macintosh Display Card 8*24 and Macintosh Display Card 8*24 GC are shipping with Macintosh 16" Color Display support (new ROMs).

Macintosh Quadra Series

Model	Bit Depth
Macintosh Quadra 700	8-bit/32-bit**
Macintosh Quadra 900	8-bit/32-bit**

** The 32-bit support includes 24-bit support (16.7M colors) as well as an 8-bit alpha channel.

Published Date: Feb 18, 2012

Mac Video Cards: Older Versions Compatible With Mac II Series

Are the older versions of the Macintosh video cards compatible with all Macintosh II series computers?

This article has been archived and is no longer updated by Apple.

Yes. The older 4-bit and 8-bit Macintosh video cards (661-0376 and 661- 0492, respectively) are compatible with all Macintosh II series computers, including the Macintosh IIfx. They're also compatible with the Macintosh Quadra computers.

Here's some additional information that might be useful. The older style video cards do not have sense line capabilities. This means that, when more than one older type video card is installed, the Macintosh will start up to the card nearest the power supply NuBus slot. Or, when older type video cards are used in combination with later version video cards, the Macintosh will always start up to the older version video card, regardless of NuBus slot positioning.

The older style video card takes precedence because of its lack of sense line capability.

Service Source CD-ROM: DART 1.4 - Erroneous Virus Warning

When I try to run DART from my Service Source CD, I get a warning message that the DART program is infected with a virus and I should quit the program as soon as possible and load new software from backups.

Is the Service Source CD infected with a virus?
This article has been archived and is no longer updated by Apple.
The Service Source CD does not have a virus on it. The DART application on the CD is an older version (1.4). When DART 1.4 is launched on some systems (Macintosh IIfx and Macintosh Quadra series) running system software version 7.0.1, it presents a dialog box stating that there is a virus. This seems to be a problem with DART 1.4.

The latest version of DART (1.5) does not exhibit this problem. The Service Source group is aware of the problem and will be removing the DART application from future releases of the Service Source CD.

TA48097_LaserWriter_Using_in_a_Classified_Environment_(TIL09742).pdf

LaserWriter: Using in a Classified Environment

Article Change History

08/25/92 - REVIEWED
* For technical accuracy.

I use my LaserWriter II in a classified environment. Does the LaserWriter II contain any non-volatile RAM that can be used to store classified information?

This article has been archived and is no longer updated by Apple.
It would be very difficult to store a user program or data in the LaserWriter printer's EEROM or ZPRAM. The only documented way to write information to non-volatile memory is to use the PostScript operators as defined in the "PostScript Language Reference Manual". There is a way to write directly to non-volatile memory, but Adobe does not make this information available to the public.

Here's a list of LaserWriter printers and the amounts and locations of non-volatile memory:

Printer	Amount & Location of Non-Volatile Memory
LaserWriter	512 bytes of EEROM
LaserWriter Plus	512 bytes of EEROM
LaserWriter IISC	none
LaserWriter IINT	512 bytes of EEROM
LaserWriter IINTX	2048 bytes of ZPRAM
LaserWriter IIf	8192 bytes of EEROM
LaserWriter IIg	8192 bytes of EEROM
Personal LaserWriter LS	none
Personal LaserWriter SC	none
Personal LaserWriter NT	2048 bytes of EEROM

The EEROM and ZPRAM components are soldered into place and cannot be removed easily for servicing. There is no way to erase the non-volatile memory via PostScript.

Most sites operating in a classified environment have a designated security officer who is responsible for ensuring that no equipment with non-volatile RAM or other storage capabilities is released from the classified area. Providing the EEROM and ZPRAM information listed above should be sufficient for the security officer to determine whether the board can be released from a classified environment.

No One-Keystroke Way to Change Desktop Color

What is the key combination to change the desktop color of my Macintosh?

This article has been archived and is no longer updated by Apple.
There is no Apple-provided key combination that changes the color of your Macintosh desktop. If you've seen someone change the desktop color this way, it was most likely with a product that was used to automate the process of using a control panel to change the desktop color. Look for third party macro programs like QuicKeys which may be able to accomplish this for you.

For more information, search on "CE Software" and "3rd".

Personal LaserWriter LS: Use 100 ns or Faster DRAM (8/95)

Can I use 60 ns 256K x 4-bit DRAM to upgrade a Personal LaserWriter LS?

This article has been archived and is no longer updated by Apple.

Yes. The Personal LaserWriter LS specifications state that you can use RAM rated at 100 ns or faster, and 60 ns RAM is faster than 100 ns RAM. Although the RAM is rated faster than 100 ns, it still will be accessed at the 100-ns rate.

HDI-30 SCSI System Cable: Connects PowerBook to a SCSI Device

Is the Apple HDI-30 SCSI Disk Adapter Cable for the Macintosh PowerBook 100 compatible with the Dayna EZ-10BASE T SCSI interface, and can I use this cable to connect the Dayna product to the PowerBook 100?

This article has been archived and is no longer updated by Apple.
No. The Apple HDI-30 SCSI Disk Adapter Cable cannot be used as you describe. This cable is used to connect a PowerBook 100 to another Macintosh, which enables the PowerBook 100 to be used as an external hard drive on the other Macintosh system.

The Apple HDI-30 SCSI System Cable is used to connect any Macintosh PowerBook to an external SCSI device that conforms to SCSI standards. This cable is 19 inches long and has a standard 50-pin male SCSI connector. We don't have any specific compatibility information about the Dayna product at this time.

LaserWriter IIg: How Printer Handles Three Communication Ports

How does the Apple LaserWriter IIg handle print jobs among the three communication ports?

This article has been archived and is no longer updated by Apple.
The LaserWriter IIg has three communication ports that can be active simultaneously. Special arbitration logic controls the activity between the three ports. The port arbitration has nothing to do with the LocalTalk or EtherTalk PAP layer connection arbitration.

Because PostScript can process only one job at a time, only one port can have access to the printer at any given time. The ports are polled in a round-robin fashion until activity is sensed in one of the three ports. Polling is then terminated as a connection is established and execution of a job begins. A connection, in this sense, refers to the dedication of the printer to a communication port while PostScript jobs are received from a host. AppleTalk ports may process multiple jobs during a single connection while the other serial port connections consist of only one job. A non-AppleTalk connection is considered terminated when an EOF (end-of-file indicated end-of-job) character is received.

The port arbitration cycle begins whenever a connection is terminated by a host. The polling order is determined by starting with whichever port has gone unpolled for the longest period of time. The port waiting the next longest is the next to be polled, with the last active port being the last to be polled again. This procedure ensures that one port will not dominate the printer. If a port is opened directly by an active PostScript job, that port is excluded from arbitration until it is again closed. An example of this type of port activity is when a serially connected sheet feeder is opened by a PostScript job.

All three ports respond to status request, with current printer status, unless they are excluded from the port arbitration cycle due to being opened directly by a PostScript job or just configured inactive. Directly opened ports may either respond with stale status or not respond at all. Ports that are not arbitrated due to configuration may not respond or even appear on the network.

Polling an AppleTalk Port

Printer AppleTalk Port Driver
------- ---------------------
inquire-> Any Open Conn on this port since last inquire or last closed connect (which ever occurred last)?

YES = True
NO = False

If True-> GetNextjob - uses PAP connect arbitration to get oldest of valid OpenConn request for this port.*

If no OpenConn is received by 5 second time-out, GetNextJob cancelled and port arbitration cycle resumed.

If OpenConn is received in time, connection established and PostScript job is read and executed.

At end of job, close connection and resume port arbitration

cycle.

If False-> Poll next port

*GetNextJob is active on only one AppleTalk port at a time and never for more than 5 second timeout.

Polling a Serial Port

inquire-> Any characters received on this port since last inquire or last EOF (whichever occurred last?)

Yes = True
No = False

If True-> Open connection established and PostScript job is read and executed from that port.

At end of job, close connection and resume port arbitration cycle.

If False-> poll next port

Macintosh: Correcting ID -127 Internal File System Error

I have a Macintosh II running system software version 6.0.5 and AppleShare 2.0.1 as a network server.

Using the AppleShare Admin program, I tried to change a group of nested folders from locked to unlocked. When I clicked the Locked box and selected the Change All Enclosed Folders option, I got error ID -127. I don't get this error message if I unlocked the folders individually.

This article has been archived and is no longer updated by Apple.
Error ID -127 is an internal file system error. You may have a damaged directory tree.

Here are some corrective measures to try:

- Start up the Macintosh from the System Tools Disk and run Disk First Aid to repair any minor damage.

- Rebuild the desktop. To rebuild the desktop, press and hold the Option and Command keys while starting up the Macintosh until you see the message asking whether you want to rebuild the desktop.

- Reinstall the system software and the AppleShare software.

TA48110_LaserWriter_IIf_and_IIg_Controller_Board_Slot_Is_for_Testing_(TIL09761).pdf

LaserWriter IIf and IIg: Controller Board Slot Is for Testing

I noticed that on the LaserWriter IIg controller board there is a socket that looks like the usual processor-direct slot (not the SIMM slots). What is it for?

This article has been archived and is no longer updated by Apple.
This slot is used by test fixtures at the factory and Level 2 service repair center to test the LaserWriter IIf and IIg logic boards. It is analogous to the edge connector on the Macintosh II logic board.

Published Date: Feb 18, 2012

Macintosh: Spacing and Font Substitution

I'm using system software version 6.0.7 and printing text in Geneva. Instead of getting the bitmapped font, I want to substitute it for Helvetica. I checked the Font Substitution box in Page Setup ╔, but the printout isn't exactly the same size and spacing as the one printed in Helvetica. Shouldn't it be the same in both Helvetica and Geneva?

This article has been archived and is no longer updated by Apple.
When using font substitution (in this case substituting Helvetica for Geneva), the font used in place of Geneva (Helvetica) will use the Geneva spacing, not the Helvetica spacing. The point size, however, should be the same (that is, Geneva 12 point will substitute Helvetica 12 point). Only the spacing will be different.

Two versions of the same document (one using Geneva on screen and one using Helvetica on screen) would look different when printed, even though you print both documents in the same font (Helvetica).

Published Date: Feb 18, 2012

OneScanner: Not Recognized at Startup

I've had an ongoing issue with a Macintosh Quadra 700 and the Apple OneScanner. The OneScanner worked once, then failed. I checked the Macintosh Quadra and scanner for proper drive termination, and reseated/replaced the SCSI cable.
This article has been archived and is no longer updated by Apple.
All Apple OneScanners with ROM version 2.02 could have a SCSI ID recognition issue when connected to any Macintosh Quadra or Power Macintosh computer. The Apple OneScanner is not recognized on the SCSI bus if the OneScanner is powered on before the Macintosh.

Workaround:

Using the OneScanner with a Quadra or Power Macintosh
---
1) Power on the Macintosh, and let it start up to the Finder.

2) Power on the Apple OneScanner.

The OneScanner has, approximately, a 12 to 13 second power-on sequence. This power-on sequence consists of a variety of audible motor calibrations. The sequence is complete when you hear the last sound -- about 12 seconds after switching on the power.

Using the OneScanner With a Quadra Running A/UX
---
1) Power on the Apple OneScanner.

The OneScanner has, approximately, a 12 to 13 second power-on sequence. This power-on sequence consists of a variety of audible motor calibrations. The sequence is complete when you hear the last sound -- about 12 seconds after switching on the power.

2) Power on the Quadra.

3) Start up A/UX, and wait for the Log-in screen. DO NOT log in.

4) Turn off the Apple OneScanner, wait a few seconds, and turn the Apple
OneScanner back on.

5) Log in to A/UX.

The Apple OneScanner should be recognized now. If not, try the process again.

Notes
---
* Use the standard gray terminator with the OneScanner and the Quadra or Power Macintosh.

* Apple has tested these workarounds, and they seem to work in most instances. However, Apple makes no guarantee that these workarounds are successful100% of the time.

* This Apple OneScanner recognition problem applies only to the Macintosh Quadra and Power Macintosh series. No other Macintosh models are affected.

* The Apple OneScanner ROM version 2.03 corrects the recognition problem, and Apple Service inventory consists of the upgraded boards.

If you are unsure which ROM revision your Apple OneScanner (or any other SCSI device) has, connect the SCSI device to a Macintosh computer and launch SCSI Probe 3.4 or later. SCSI Probe provides the SCSI ID, device type, vendor info, product name, and version information.

* Apple OneScanner owners with Macintosh Quadra computers who want to upgrade to ROM version 2.03, instead of using the workaround, should contact their Apple Authorized Service Provider for a replacement board.

QuickTime: Guidelines for Using Compressors

We are a little confused about compression alternatives, and uncertain about how we might accelerate compression. When does JPEG make sense?

This article has been archived and is no longer updated by Apple.

Below is a section from the QuickTime Developer's Guide that is included on the QuickTime 1.0 Developer's CD. It gives specific information about each of the compressors that Apple has included in QuickTime, including guidelines on when each should be used.

Photo Compressor

The photo compressor implements the Joint Photographic Experts Group (JPEG) algorithm for image compression. JPEG is an international standard for compressing still images. The version of JPEG supplied with QuickTime complies with the baseline International Standards Organization (ISO) standard bitstream, version 9R9. This algorithm is best suited for use with still images.

The photo compressor performs best on images that vary smoothly or that do not have a large percentage of their areas devoted to edges or other types of sharp detail. This is the case for most natural images. In practice, you will find that compression ratios are highly dependent on source images, but they generally range from 5:1 to 50:1 at 24 bits-per-pixel, with good picture quality resulting from compression ratios between 10:1 and 20:1.

Picture quality is generally very good to exceptional and is often good enough for use in demanding desktop publishing applications. Very high-resolution images obtained through the use of 24-bit color scanners would best be compressed using the photo compressor.

On a Macintosh IIsi using a compression ratio of 10:1, the photo compressor can compress a 24-bit 640-by-480 pixel image at a normal quality setting in 7.5 seconds. Decompressing the same image takes 7 seconds.

Video Compressor

The video compressor employs an image-compression method developed by Apple. This method was designed to permit very fast decompression times while maintaining reasonably good picture quality. This algorithm's rapid decompression allows applications to display 24-bit images at interactive speeds. This algorithm is best suited for use with sequences of video data.

The video compressor is best suited to digitized video content rather than synthetically generated images. This compressor supports both spatial and temporal compression. If you use only spatial compression, you obtain compression ratios from 5:1 to 8:1 with reasonably good quality at 24-bit pixel depths. If you use both spatial and temporal compression, the compression ratio range extends from between 5:1 to 25:1.

The video compressor can be used for computer animation as well as digitized video, but you obtain higher image quality using the animation compressor. Similarly, the animation compressor can be used for digitized video as well as animation, though you obtain higher compression ratios from the video compressor.

On a Macintosh IIsi using a compression ratio of 6.5:1, the video compressor can compress a 24-bit 640-by-480 pixel image at a normal quality setting in 3.5 seconds. Decompressing the same image takes 1.0 second.

Animation Compressor

The animation compressor employs a compression algorithm developed by Apple. This technique is best suited to animation and computer-generated video content. In addition, the animation compressor can be used to compress sequences of screen images, as might be generated for a training application.

The algorithm employed by the animation compressor is similar to applying the PICT image format to the temporal domain. A PICT image is stored in run-length encoded format and is lossless. The animation compressor also stores images in run-length encoded format. However, the animation compressor can work in either a lossy or lossless mode. The lossless mode maintains picture content precisely, storing an animation as a series of run-length encoded images. The lossy mode loses some quality, but is fast enough for real-time playback.

The animation compressor's performance and achieved compression ratios are highly dependent on the type of images in a scene. The animation compressor is very sensitive to picture changes, and works best on a clean image that has been generated synthetically. Images captured from videotape generally have considerable visual noise, which can corrupt the inherent similarity of the pixels and make it more difficult for the animation compressor to achieve good compression.

On a Macintosh IIsi using a compression ratio of 1.3:1, the animation compressor can compress a 24-bit 640-by-480 pixel image at a normal quality setting in 2.0 seconds. Decompressing the same image takes 1 second.

Graphics Compressor

The graphics compressor employs a compression algorithm developed by Apple. This compressor is best suited to 8-bit still images and image sequences in applications where compression ratio is more important than decompression speed.

The graphics compressor is a good alternative to the animation compressor whenever performance is less important than compression ratio. In

general, the graphics compressor generates a compressed image that is one-half the size of the same image compressed by the animation compressor. However, the graphics compressor can decompress the image at only half the speed of the animation compressor. Therefore, you should consider using the graphics compressor with relatively slow storage devices, such as CD-ROM. In these circumstances, the graphics compressor has sufficient time to decompress the image or image sequence.

On a Macintosh IIsi using a compression ratio of 2.5:1, the graphics compressor can compress a 24-bit 640-by-480 pixel image that has been dithered to 8-bit pixel depth at a normal quality setting in 17.0 seconds. Decompressing the same image takes 1.0 second.

Qume QVT101 Emulation on Macintosh

Can the Macintosh emulate a Qume QVT101 terminal (a superset of VT100)? When I use standard VT100 emulation on the Qume QVT101, I can't do some operations. The Qume QVT101 has some extra features on top of the normal VT100, and applications on the mini want to see the QVT100 and use those additional features.

This article has been archived and is no longer updated by Apple.

We checked with Qume and found that the Qume QVT 101 emulated the Hazeltine 1500, TeleVideo 910 and Lear/Seigler 3A5 terminals. The Qume QVT 101 is an obsolete product.

MacEmulate from Cornerstone Data Systems emulates both the Hazeltine 1500 and the Televideo 910.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder. Or search on "Cornerstone".

MacWorks XL: Error on Hard Disk Startup

This article has been archived and is no longer updated by Apple.
A problem with the released version of MacWorks XL can be worked around, even though the exact cause is not clear as yet.

After installing MacWorks on a hard disk dedicated only to Macintosh files, you may get the following error during the boot process: the expansion card icon appears with an X through it and a 2 inside it. There may also be the number 90 below it.

At this point, you have a choice of starting up from one of two disks: hard or floppy. The system will start up fine after you click on the hard disk icon; however, you must make this choice each time for start up. If you unplug the Macintosh XL to clear parameter memory and then reboot, it works fine, directly booting from the hard disk. But the same error message appears the next time you boot.

There are two workarounds: the first takes more time and the second takes more equipment.

First workaround:

1. Install Lisa office system.
2. Set preferences to boot from the hard disk.
3. Re-install MacWorks.

Second workaround:

1. Install a parallel card.
2. Boot Lisa.
3. Set Preferences to Boot from the internal hard disk.

DEC VT100, 101, and 102 Terminals: Have No Function Keys

We're installing MacTerminal 3.0 on a Macintosh SE/30 with an extended keyboard II to do VT100, 101, or 102 emulation on a SCO Xenix 2.3.4 system. The function keys 1 through 5 don't operate.

This article has been archived and is no longer updated by Apple.
Because you're trying to emulate DEC VT100, VT101, or VT102 terminals, we assume you're using the VT102 Tool rather than VT320.

This isn't a problem with MacTerminal 3.0, or the VT102 Tool. If you look at the real DEC VT100, 101, or 102 terminals, they don't have any Function Keys such as F1 through F20. They only have the PF keys, PF1 through PF4 -- the top four keys on the keypad. The VT102 Tool maps these keys to the Keys menu, or the Macintosh keyboard keypad:

Key Pad Keys

PF1 Num lock/Clear
PF2 =
PF3 /
PF4 *

So, since the VT102 Tool emulates the VT102 terminal, it doesn't have to provide the function keys F1 through F5, which don't exist on the real terminal.

On the real VT320 keyboard, F1 through F5 are Hold Screen, Print Screen, Set Up, F4, and Break, respectively. The VT320 emulates all except the F4 keys in the VT320 Tool using the File Menu, Settings Menu, Session Menu, or Option Keys combination.

You will have to reprogram your application to accept other keys, if that's possible. The VT320 Tool will allow mapping of function keys F6 through F20.

AppleTalk, TCP/IP, and IPX: Simultaneous Routing

Are there any third-party software products that allow simultaneous routing of TCP/IP, IPX, and AppleTalk?

This article has been archived and is no longer updated by Apple.

Novell

There's a Novell router-only product -- basically a Novell 3.11 server without the server capabilities. The product name is Novell Multiprotocol Router 1.0. It supports the routing of IPX, TCP/IP, AppleTalk, and Arcnet.

The NetWare Multi-Protocol Router v1.0 provides customers with a standalone router solution that includes the AppleTalk router. The Multi-Protocol Router provides routing of AppleTalk packets across a Novell network.

IBM

The IBM 6611 Network Processor routes AppleTalk protocol. The IBM 6611 -- which also supports routing for TCP/IP, DECnet, NetBIOS, IPX and XNS networks and SNA data link switching -- enables AppleTalk users to connect to a wide variety of local and remote communications resources located on their network.

AppleTalk

AppleTalk, Apple's local area network protocol suite, is built into every Macintosh computer and networked LaserWriter, and provides users with easy access to network resources. The dynamic nature of AppleTalk allows easy growth, change and automatic reconfiguration of networks. AppleTalk ensures resources are viewed in a consistent manner, independent of the computing platform on which the resources reside. AppleTalk protocols are broadly licensed and supported by leading equipment manufacturers.

FriendlyNet: Fiber-Optic Transceivers

I need to know if anyone manufactures a fiber transceiver for the Macintosh to plug into the Quadra (Friendly Net connector). We're running fiber instead of twisted/thin/thick Ethernet cable. It will be at Ethernet speed, but the cable type is fiber. Do you know of any companies that have such a product?

This article has been archived and is no longer updated by Apple.

There are no FriendlyNet compatible fiber-optic transceivers available at this time. The Ethernet specification (10BASE-F) for data transmission using fiber hasn't yet been approved as a final specification. There are several vendor-specific implementations of fiber-based Ethernet, but most are incompatible with each other and with the proposed 10BASE-F specification. Several vendors have fiber-optic transceivers you can attach to the FriendlyNet thicknet transceiver option.

```
[Mac]-----------------[FTT]-------------------------[FT]------ENET--
AAUI              FriendlyNet                    Std. AUI   Fiber
Cable             Thicknet transceiver           Cable      Transceiver
```

If you have a fiber plant installed with an Ethernet running, you should have access to these types of transceivers from the vendor who originally supplied the fiber network components. Allied Telesis, BlackBox, and Canary all sell fiber transceivers.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

PowerBook Modem: Workaround for 40-Char Command Buffer Limit

Does the PowerBook modem have a data register of 40 characters? I'm trying to dial a Sprint number, and the modem cuts off characters after 40 digits. I'm using White Knight, and can't send the whole string of characters. Is there a workaround? Is this a limitation of the modem?

This article has been archived and is no longer updated by Apple.
Yes, there is a 40-character command buffer limit in the PowerBook modem, but there is a workaround.

By using the ; (semicolon) command, you can enter phone numbers (or any command for that matter) longer than 40 characters. You will need to break the phone number up into two separate commands, each less than 40 characters. The semicolon (;) command returns the modem to local command state after dialing. You must put the semicolon (;) at the end of the dialing command.

For example, if you want to dial (408) 555-1212, follow these steps:

1) Enter: ATDT408555;
2) Press RETURN.
3) Wait for OK.
4) Enter: ATDT1212
5) Press RETURN.

System 7 Finder: Repairing Preferences File that Loses Settings

We have Macintosh computers (PowerBook 170 and IIcx) running System 7. They will not retain default settings, such as changes to Views (like font size) or the Trash warning. After a restart or shut down, the settings return to default. Resetting the PRAM does not help.
This article has been archived and is no longer updated by Apple.
It sounds like you might have a corrupted Finder Preferences file, found by following this path:

System Folder
- Preferences
--Finder Preferences

Try the following procedure:

- Put the existing Finder Preferences file in the Trash can .
- Restart your computer. (This will automatically create a new Finder Preferences file.)
- Empty the Trash can.

MacTCP: Syntax of Hosts File

I have a question about the Host file for MacTCP used in the remote commands to edit/create in MacX. With the Host... button I can select the connection method and the host. The MacX documentation specifies that the Host List will contain the names in the Hosts file of the System Folder.

How is the Host file created and what is the format? I haven't been able to get any names to appear in this list, so I use the network dot address for testing. I've tried creating a Host file like the /etc/hosts file on A/UX with TeachText (format <dot address> <host name>), but with no success.
This article has been archived and is no longer updated by Apple.
Note: The syntax for a Hosts file under Open Transport TCP/IP is different. See Technical Information Library article, "Open Transport 1.1/TCP Supports HOSTS File", for Open Transport.

The syntax of the Hosts file used with MacTCP conforms to the master file syntax specified in RFC (Request For Comment) 1035. Here is the syntax:

name type data [;comment]

name = the name assigned to a host or domain on the internet.

type = the type is one of the three below:

- "A" for address
- "NS" for Name Server
- "CNAME" for Canonical name

data = determined by the type specified

comment = this is optional and begins with a semicolon (;)

The syntax of /etc/hosts file in A/UX is not compatible with the syntax of RFC 1035.

You can use a sample Hosts file which is included in the MacTCP software distribution to edit/add/delete entries and create a new Hosts file for your network.

Here are sample entries in a Hosts file:

roland1 A 130.252.11.27 ; Mike Berg

bruce A 130.252.11.30 ;

windx A 130.252.11.31 ; Rudy Martin

rizzi A 130.252.11.32 ; John Rizzi

scoodt A 130.252.11.33 ; Rudy Martin

renee1 A 130.252.11.34 ; Renee Gibson

paul A 130.252.11.35 ;

wendy A 130.252.11.36 ;

frank A 130.252.11.37 ;

setlab A 130.252.11.38 ; Craig Adams

dick A 130.252.11.39 ; Dick Mahoney

xshare A 130.252.11.40 ; Rudy Martin

rudy A 130.252.11.41 ; Rudy Martin

eagle A 130.252.11.42 ;

Note: You have to restart your computer after making changes to the Hosts file. The file should be named "Hosts" and should be in the system folder, not in any other folder.

For more information on the syntax of MacTCP Hosts file, refer to Appendix A, Name-to-Address Mapping, in the "MacTCP Administrator's Guide."

A/UX: TCP/IP Routing Via Ethernet and SL/IP (8/94)

I know that A/UX supports the routing of TCP/IP protocols and services between two Ethernet networks when the A/UX system is properly configured and has two Ethernet adapters in it.

I also know that A/UX supports SL/IP connections for providing TCP/IP protocols and services over direct or dial-up serial connections.

Can A/UX support TCP/IP routing between two networks, one via an Ethernet connection, and the other via SL/IP?

This article has been archived and is no longer updated by Apple.
Yes, A/UX supports TCP/IP routing among networks. In A/UX, however, the "ipforwarding" parameter was turned off when it is installed, so that a host can't arbitrarily become a gateway.

You can turn the "ipforwarding" parameter back on by doing the following adb (kernel debugger) command:

```
# adb -w /unix
====> a.out file = /unix (COFF format)
====> cannot open core
====> ready
ipforwarding?D
====> ipforwarding: 0
ipforwarding?W 1
====> ipforwarding: 0x0 = 0x1
$w
$q
====> #
```

Then restart A/UX so that the change will take effect. You might also want to make the same change to the /etc/install.d/boot.d/bnet_dr file (adb -w bnet_dr) in case you build a new kernel via newconfig at some later date.

If you would rather not restart, do this:

```
# adb -w -w /unix /dev/kmem
====> a.out file = /unix (COFF format)
====> core file = /dev/kmem
====> ready
ipforwarding/W 1
====> ipforwarding: 0x0 = 0x1
$w
$q
```

This changes the running kernel (/dev/kmem) without affecting what will happen after the next start. You can do both changes in one session. The "-k" flag is recommended when working on standalone programs such as the kernel (that's why it's named "-k").

A/UX: When It Builds a New Kernel

Article Change History

04/30/92 - REVIEWED
* For technical accuracy

Sometimes A/UX automatically builds a new kernel when I change the hardware configuration (different CPU type, more memory, new Ethernet card). Other times it doesn't, and just starts fine on the new configuration.

When and why does A/UX decide to build a new kernel?

This article has been archived and is no longer updated by Apple.
In general, A/UX rebuilds a new kernel for the following reasons:

- Someone has removed the existing NuBus card (which has driver like ae6 in kernel) such as Ethernet or EtherTalk card, or SuperMac Comm Card, and replaces it into a DIFFERENT slot.

- Someone adds a new NuBus card (with the driver that came with A/UX) onto the system.

- Someone issues a "newconfig" command.

If you move an A/UX drive onto a different CPU and the NuBus card matches the one in A/UX, then A/UX won't rebuild its kernel when it starts. Otherwise, it should rebuild a new kernel to match the existing hardware.

Adding or removing memory doesn't require a new kernel rebuild. A/UX automatically recognizes its available memory size at startup.

Adding or removing video cards doesn't require a new kernel either since there is no new driver in A/UX to configure.

TA48136_MacX_Isnt_OSF_Compliant_(TIL09793).pdf

MacX: Isn‘t OSF Compliant

Is MacX OSF compliant, as opposed to complying, to the International UNIX standards?

A 1989 Tech Info article, "A/UX: X Windows Questions and Answers," states that Integrated Computer Solutions offers an OSF compliant X Window by providing a MOTIF Window Manager. Is this still the case?

This article has been archived and is no longer updated by Apple.
MacX isn't OSF compliant. It's based on X11 Release 4 Window System Protocols; it has nothing to do with OSF or UNIX International's UNIX standards. OSF (Open Software Foundation) and UNIX International are two major UNIX organizations trying to set their standards for the UNIX industry; they aren't particularly discussing X Windows. The X Consortium is the one that defines and sets all the standards for X Window system. Apple is a member of all three organizations.

MOTIF is an X Window Manager, developed by OSF. (It follows X protocols of course.) The product is sometimes called MOTIF/OSF, since it's an OSF product. ICS (Integrated Computer Solutions) is a company that ported in the MOTIF Window Manager for A/UX.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

TA48137_Alysis_Systems_Compatibility_INIT_How_it_Works_on_the_Quadra_(TIL09794).pdf

Alysis Systems‘ Compatibility INIT: How it Works on the Quadra

How does the Alysis Systems Compatibility INIT for the Quadra series work?

This article has been archived and is no longer updated by Apple.

Alysis Systems Cache Switch INIT on Quadra

The Alysis Compatibility INIT 2.2 automatically toggles the cache on the Quadra 700 and 900, on-the-fly without having to restart. It also toggles the cache between compatible and non-compatible applications while you are multi-tasking. Unlike earlier versions, version 2.2 will also recognize non-compatible Apple Menu Items (DAs). Users may add names of programs they find to be incompatible with the Quadra or delete them as they become compatible. Businesses and resellers are required to contact Alysis Software for licensing and distribution rights.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

Apple's Internal Cache Switch on Quadra

Don't change the caches on or off without restarting a Quadra 700, or you may encounter LocalTalk network problems. When the Quadra 700 starts, the system determines its effective processor speed (this has nothing to do with the 68040's clock speed, and everything to do with the mode of the processor's caches), and sets certain internal timings according to this effective processor speed.

Two of the more important timings are for the floppy disk drive and LocalTalk. Therefore, when the Quadra 700's caches are switched without restarting, the timings set at startup are no longer valid, and the floppy disk drive and LocalTalk won't work (or won't work properly). We monitored a Quadra 700 after switching the caches on the fly. It transmitted an inordinate amount of fragmented packets and never successfully registered itself on the network, or registered and never located network services.

The Quadra 900 features the Peripheral Interface Controllers (PIC chips) of the Macintosh IIfx. These I/O processors seem to work OK after having the caches switched on/off on the fly, but we have a lot more testing to do before we recommend this procedure.

Note the third-party cache switches routinely switch the caches on or off on the fly, whereas the cache switch Apple distributes on the Tidbits disk will only turn on or off the caches immediately if you hold down the option key when changing the cache setting.

MacX: Which Macintosh Models Support It

Does the Quadra 700 support MacX?

This article has been archived and is no longer updated by Apple.
Yes, Quadra 700 supports MacX. Basically, all Macintosh computers from Macintosh Plus up to the Quadra 900 and PowerBooks with at least 2MB of RAM and with system software version 6.0.5 or later supports MacX.

The Macintosh 512K may run MacX too if you can upgrade the third-party RAM to at least 2MB. For color display, we recommend at least 4MB.

A/UX: Converting from Apple Single to Apple Double Format

Article Change History

05/07/92 - REVIEWED
* For technical accuracy
01/06/93 - REVISED
* To expand information about the fcnvt utility.

Is there a utility that will convert from Apple Single format to Apple Double format (Resource and Data Fork) and back?

This article has been archived and is no longer updated by Apple.
A utility program called 'fcnvt' comes with A/UX, and is a hybrid application with A/UX and Macintosh Toolbox calls. Under A/UX the 'fcnvt' utility converts a file in one storage format to a corresponding file in a different storage format.

We suggest you upload files to A/UX and make any conversion there, then download to the Macintosh operating system.

The formats supported are:

AppleDouble
AppleSingle
MacBinary
BinHex
Plain Pair
Plain Triple

A/UX also provides the utility 'setfile' that lets you set a file TYPE and CREATOR. It also lets you set file attributes (that is, invisible, locked, and so on).

For more information on either of these commands look in the A/UX manual pages or use the A/UX man program.

A/UX: Only One Macintosh Environment Allowed (9/94)

I would like to run two copies of the Finder of A/UX 2.0.1 or 3.0 so that I then can run two copies of AppleShare on a computer. Is it possible to have two Macintosh environments running under A/UX?

This article has been archived and is no longer updated by Apple.
No, it isn't possible for two Macintosh environments to run simultaneously under A/UX 2.0.1 or A/UX 3.0. Only one Macintosh environment is allowed under A/UX. When the "mac32" or "mac24" process is invoked, it actually starts up the "startmac" or "startmac24" program to create a Macintosh environment. Then the Finder in the System Folder will be executed. This operation is running under Macintosh Toolbox File Manager control; it isn't a re-entrant type of program.

Note that A/UX is capable of supporting Macintosh File Sharing (in A/UX 3.0) and AppleShare CLIENT functionality. The AWS 95 can run AppleShare Pro.

TA48142_LaserWriter_Form_feeds_and_blank_pages_(TIL00980).pdf

LaserWriter: Form feeds and blank pages

This article has been archived and is no longer updated by Apple.

In Diablo 630 Emulation mode, the LaserWriter prints a page under two conditions: (1) when it reaches the end of a page, or (2) when it receives a form feed. The LaserWriter cannot detect the end of a document; it simply assumes that the document has come to an end when data stops arriving.

If the last page of a document isn't full and doesn't end with a form feed, the printer doesn't print it immediately; instead, it waits for a printer timeout, which occurs (1) as soon as the next document arrives, or (2) after 30 seconds, if no document arrives before that. You can avoid this delay by being careful to include a form feed at the end of your document's last page.

During printing there is a step called data preparation. In this step, the Laserwriter determines how many pages it takes to print the document. There is a possibility that one character, even a carriage return, will force the generation of a blank page at the end of the document. With MacWrite documents, the Laserwriter prints this last page first.

Ethernet NB Card: Install EtherTalk 2.5.1 or Later

We have a Macintosh IIsi with an Ethernet NB card, and we're having problems installing EtherTalk software from the System 7.0.1 disks. When we choose EtherTalk, the software appears to be installed, but it doesn't work.

However, when we first install System 7.0.1, and then install the EtherTalk software from the EtherTalk 2.5.1 disk, everything works correctly.

This article has been archived and is no longer updated by Apple.
The EtherTalk software that ships with System 7.0 and System 7.0.1 was written prior to the introduction of the Ethernet NB board. In this case, the software was written with System 7.0 and carried forward to System 7.0.1, so it doesn't install an Ethernet driver for the Ethernet NB board. It only installs a driver for the older EtherTalk NB board and the built-in Ethernet on the Macintosh Quadras.

You can find the most current versions of Ethernet software for all of our boards on the NSI 1.1 disk. You can find an image of this disk in the Software Updates folder on AppleLink.

Macintosh Parity-Equipped: Parity Bits Reset Between RAM and VM

Will a parity-equipped Macintosh (with virtual memory enabled), such as the Macintosh IIci, maintain parity when paging information between RAM and virtual memory?

This article has been archived and is no longer updated by Apple.
The question implies a loss of functionality if the parity bits aren't written out to virtual memory. Actually, this isn't the case. Virtual memory has no need to keep track of the RAM parity bits in parity-equipped Macintosh computers.

The reason is that the parity bits are set when you write to RAM. When virtual memory pages information back into RAM, the parity bits are set once again as appropriate. Since the parity bits are for handling data corruption in RAM, once you write to disk, it's up to the disk, its driver, and the file system to ensure data integrity rather than using the same mechanism used in "parity" RAM.

Also, when virtual memory reads the information in RAM, it doesn't have access to the parity bits. It reads a byte; it gets that byte's value.

Finally, imagine the excess overhead associated with moving around and storing that additional information. If you had 16MB set for virtual memory, you would need an extra 2MB of disk space just to handle the parity bits.

A/UX 3.0: Support for QuickTime

Does A/UX 3.0 support QuickTime?

This article has been archived and is no longer updated by Apple.
Yes, A/UX 3.0 supports QuickTime. A/UX 3.0 fully integrates QuickTime into the Macintosh environment running under UNIX. This is one of the first UNIX-based systems that integrates dynamic data such as sound, video, and animation into documents.

Published Date: Feb 18, 2012

QuickTime: Creating and Distributing Movies

How do I create and distribute QuickTime movies?
This article has been archived and is no longer updated by Apple.
You can create QuickTime animation movies by saving your animation as a QuickTime Movie from a wide variety of upgraded QuickTime-savvy applications. A utility in the QuickTime Starter Kit will also let you convert appropriate Macintosh and DOS file formats to QuickTime movies. Utilities in the Movie Exchange Toolkit will also let you convert content on other platforms to QuickTime movies.

If you want to create a video QuickTime movie, the easiest way is by using one of the new QuickTime digitizer cards, such as VideoSpigot from SuperMac. For higher-quality capture, there are several tools in the QuickTime Developer's Kit, that allow for controlled capture from laserdiscs and professional video equipment.

A QuickTime movie is just a regular Macintosh file -- you can distribute it as you would any ordinary Macintosh file. But because QuickTime movies are typically large, you'll usually use storage media such as CD-ROM, removable mass storage, or networks. You can also record your presentations, including QuickTime movies, to videotape using any number of third-party RGB-to-NTSC/PAL hardware solutions.

QuickTime: System Requirements and Installation

What are the system requirements for QuickTime, and what else do I need to do before installing it? Will it work with a SCSI-based graphics adapter?

This article has been archived and is no longer updated by Apple.

QuickTime requires a Macintosh computer with a 68020 or later microprocessor, with system software version 6.0.7 or later. Apple recommends at least 4MB of memory when using QuickTime with System 7. QuickTime relies on the capabilities of 32-bit QuickDraw, which only runs on 68020 or later Macintosh computers.

With System 6.0.7, the 32-Bit QuickDraw file is located on the Printing Tools disk in the Apple Color folder and isn't automatically installed. You must install it manually. With System 7 and later versions, 32-bit QuickDraw is built into the system software, and a separate file for 32-bit QuickDraw is no longer required.

If you want to use QuickTime on an older Macintosh, you might be able to upgrade the unit or use a third-party board to bring it up to a 68020 CPU or higher. QuickTime will then work with System 7 installed, or with the 32-bit QuickDraw file installed in system 6.0.5 or 6.0.7.

In regards to QuickDraw working on a SCSI-based graphic adapter, we don't have any testing information on its functionality with such a device. We have heard reports of these devices being significantly slower in the screen drawing process. Based on this information, we would expect QuickTime to have a very poor performance when compared to operation with direct video through a video board or built-in video.

To install, simply drag the QuickTime extension to your System Folder and restart. Please note that the Installer for QuickTime Starter Kit 1.0 will replace QuickTime version 1.5 with 1.0. Just reinstall the QuickTime 1.5 extension.

QuickTime: Movie Exchange Toolkit

What is the QuickTime Movie Exchange Toolkit?
This article has been archived and is no longer updated by Apple.
This toolkit consists of utilities, sample code, and documentation to allow developers to incorporate the QuickTime Movie file format into their non-Macintosh applications. The utilities support popular models of computers running MS-DOS, Windows, Cray, Silicon Graphics, Sun, DEC, and IBM computers.

For example, a user creating an animation in MS-DOS will have the option of converting that animation to a QuickTime movie. The animation can then be shared with Macintosh users over a network or via floppy disk, but only played back on a Macintosh.
Published Date: Feb 18, 2012

QuickTime: Video Window Size

Why is the video window so small?

This article has been archived and is no longer updated by Apple.

There is no limit in QuickTime to the size or frame rate you can have for a movie -- the only limitation is hardware. On existing Macintosh computers, and using Apple's Video Compressor, you can run 160 x 120 pixel movies at an average of 15 frames per second. The new Macintosh Display Card 8*24 GC can provide larger video windows by decompressing the video from its AMD2900 RISC processor.

TA48152_Apple_Inch_Color_Display_GC_and_Quadra_Support_(TIL09815).pdf

Apple 16-Inch Color Display: 824, 824 GC, and Quadra Support

What are the bit depths with the Apple 16-Inch Color Display and the Macintosh Display Cards 8*24 and 8*24 GC?

What support do the Quadra 700 and 900 give the Apple 16-Inch Color Display with their various VRAM configurations?

This article has been archived and is no longer updated by Apple.
The Macintosh Display Cards 8*24, 8*24 GC, Quadra 700, and Quadra 900 offer the following support for the Apple 16-Inch Color Display:

8*24 (rev B) - 1, 2, 4, and 8 bits/pixel (up to 256 colors)

8*24 GC (rev B) - 1, 2, 4, 8, and 16 bits/pixel (up to 32,768 colors)

Quadra 700 - .5MB VRAM: 1, 2, 4, and 8 bits/pixel (up to 256 colors)
1MB VRAM: 1, 2, 4, and 8 bits/pixel (up to 256 colors)
2MB VRAM: 1, 2, 4, 8 and 24 bits/pixel (up to 16.7 colors)

Quadra 900 - 1MB VRAM: 1, 2, 4, and 8 bits/pixel (up to 256 colors)
2MB VRAM: 1, 2, 4, 8 and 24 bits/pixel (up to 16.7 colors)

AppleTalk Remote Access: Manual Dialing (1/96)

I have a question about using a PowerBook 170 to communicate with a remote computer long distance. If I use a special discount phone service and have to talk to an operator to get access to the this line, when would I connect with the remote modem with Remote Access? Or can I even communicate using a phone service like this?

This article has been archived and is no longer updated by Apple.

Yes, it's possible to dial manually and still connect using AppleTalk Remote Access 1.0. The "Apple Modem 2400 with X1" Remote Access Script allows this. You can download this script from Apple's ARA Server at 512-908-8118 (connect as a Guest). Also, Apple Remote Access 2.0, the version with Dial Assist, has the ability to manually dial through the Setup Menu in the Apple Remote Access program. Upgrading to ARA 2.0 is probably easier than trying to modify the CCL script for your modem.

Background Information

The PowerBook Modem normally waits to detect a dial tone before dialing. When dialing manually it's necessary to disable this feature so the modem will attempt to "dial without a number" and connect immediately.

The only change to the original Apple Modem 2400 script was the addition of "X1" within the dial command:

```
 !
 ! The modem is ready so enable answering, or originate a call
 !
 ! To accommodate manual dialing,
 ! added X1 command to disable
 ! "wait for dial tone". - PDF 2/5/92
 !
 @LABEL 8
 pause 5
 ifANSWER 30
 note "Dialing ^1" 3
 write "ATX1DT^1\\13"
```

To use the new script, follow these steps:

Step 1

Put the script in the Extensions folder.

Step 2

Open the Remote Access Control Panel and select "Apple Modem 2400 with X1."

Step 3

Open Remote Access and enter a single space in the Phone field. (If you leave the Phone field blank, a dialog box indicates "The connection attempt has failed. You have not specified a phone number in the connection document." Entering a space gets around it.)

Step 4

Enter Name and Password as necessary.

Step 5

Place the call manually (or through your operator).

Step 6

The moment you hear the remote phone number ring, click "Connect" in the Remote Access window. (It takes about 5 seconds for the script to execute from the time you click "Connect" and when the modem goes off hook and actually tries to connect.)

Step 7

The moment you see the "Communicating at xxxx bps" message in the Remote Access Status window, hang up.

DuoDisk: Shield service and support notice

This article has been archived and is no longer updated by Apple.
Currently, all Duodisk mechanical assemblies are NOT being made with threaded screw holes in the bottom of the casing.

However, the first 5,000 Duodisks had those screw holes; they were used to mount the Duodisk mechanisms to the bottom case.

If one of the original mechanisms is replaced with a new mechanism that has no screw holes, the following parts will have to be ordered:

Part Number Description Quantity to Order

400-1604 Screw 4
415-1410 Screw 4
805-5000 Shield 1
860-0053 Washer, lock 4
860-0242 Washer 4

Whether or not the unit is covered by warranty or AppleCare, Apple will reimburse the Level I Service Center for the parts used in this action. In order to receive credit, please note 'Duodisk Installation' in the comments section of the SRO form.

If the Duodisk is out of warranty and is not covered by AppleCare, the 'Other' line in the warranty section of the SRO should be marked and 'Duodisk Installation' should be noted.

LaserWriter II Series: Possible Causes of Card Stock Jams

A customer reported that he uses his LaserWriter IINTX to print employee records onto card stock. After printing about 350 cards, the printer jams.

Are there any recommended guidelines for printing on card stock? Are there any adjustments that I can make to the printer to correct the problem?

This article has been archived and is no longer updated by Apple.
You can use up to 36-pound card stock via manual feed in the LaserWriter II series printers. However, higher weight stock has a higher content of cotton rag or other dust-producing material. This may be causing paper dust to build up on the paper pickup roller and/or separation pad, which may be causing the jam conditions.

Try cleaning the paper pickup roller with a printer platen cleaner. DO NOT use alcohol. Alcohol removes an oil compound in the rubber, causing it to shrink and damage the roller.

Note that the roller and separation pad are subject to wear. Ensure that these parts are in good working condition.

Search on LaserWriter II and specifications for more information on recommended printing material.

Macintosh: Troubleshooting Bus Error Messages

I have a Macintosh IIsi running system software version 6.0.7 and Quark 3.0. I'm getting bus error messages when I open the Chooser to select a different printer.

This article has been archived and is no longer updated by Apple.
We've had other problem reports like this and found that most were caused by the WDEF virus or a corrupt System.

To eliminate the WDEF virus as the cause, follow the instructions in the Tech Info Library article titled "WDEF" Virus: Information.

If the problem persists:

1) Remove all items from the System Folder that you want to save, like third-party INITs, CDEVs, and DAs.

2) Trash the System Folder.

3) Reinstall the system software from locked, known-good disks.

LaserWriter IIf/IIg/Pro: Switching PostScript to HP Emul (9/94)

How do I set a LaserWriter IIf, IIg, or LaserWriter Pro for LaserJet emulation, and return it to standard Apple PostScript mode?

I'm using my printer on an IBM network and need to send the commands via text file.

This article has been archived and is no longer updated by Apple.

Switching to HP Emulation for the Current Job

Below is PostScript code that will switch the LaserWriter IIf, IIg, and LaserWriter Pro PostScript interpreter into HP LaserJet IIP emulation mode for the duration of the current job. It requires first configuring the port to be used for PostScript "Binary" mode (versus Normal), or a rangecheck error will be generated.

currentfile /LaserJetIIP statusdict /emulate get exec

The code must precede each job that will use HP LaserJet IIP emulation, and only works on the LaserWriter IIf, IIg, and LaserWriter Pro printers. The emulate operator is currently specific to these printers. The emulator will exit, returning to PostScript, if either of the following conditions occur:

The current job ends.

This is defined as when the printer receives a control-D or when the

emulator's 30-second wait timeout expires. Note that this 30-second

timer can't be changed, and overrides the normal WaitTimeout value while

the emulator is in control.

The printer receives the ASCII sequence ESC-DEL-Zero (Decimal ASCII 27,

127, 48).

This causes the emulator to exit to PostScript, where more printing can

occur before the end of job. However, when the emulator exits, it ejects

the current page. This prevents any mixing of PostScript and HP LaserJet

data on a single page.

Permanently Switching to HP Emulation

A communications port can also be configured for HP LaserJet IIP emulation so that the setting persists across jobs and power cycles. This is just as if the setting were made from the LaserWriter Utility's Configure Communication feature, and requires that the push-wheel mode switch be in one of positions 6 through 9.

To configure the serial port, download this PostScript code to your LaserWriter:

```
(%Serial_NV4%)
<< /Protocol /Binary
/Interpreter /LaserJetIIP
>> setdevparams
```

The first line tells the setdevparams operator which parameter set is to be

changed. Possible values here are:

(%Serial_NV%) for push-wheel position 6

(%Serial_NV2%) for 7

(%Serial_NV3%) for 8

(%Serial_NV4%) for 9

If the mini-DIN 8 port is being used, substitute "SerialB" into the string for all instances of "Serial."

Note: If you remove the "_NV" portion from "(%Serial_NV4%)", such as (%Serial4%), the settings will not persist and the printer will return to PostScript mode under the conditions mentioned above.

To configure the parallel port, download this PostScript code to your LaserWriter:

```
%%Begin (%Parallel_NV3%) %Modifies the 3rd changeable pos.(setting 8)
<< /Enabled true %Mark a dictionary on the stack with key/value
/HasNames false %pairs for the various settings.
/Protocol /Raw
/Interpreter /LaserJetIIP
```

/On true >> setdevparams %Create the dictionary and execute setdevparams

%(which uses it to modify the parameter set.)

%%End

The first line tells the setdevparams operator which parameter set is to be

changed. Possible values here are:

(%Parallel_NV%) corresponds to 6

(%Parallel_NV2%) " " to 7

(%Parallel_NV3%) " " to 8

(%Parallel_NV4%) " " to 9

Note: If you remove the "_NV" portion from "(%Parallel_NV3%)", such as

(%Parallel3%), the settings will not persist and the printer will return to

PostScript mode under the conditions mentioned above.

Switching Back to PostScript

Switching a communications port back to PostScript mode requires sending the following variation of the above code to a port that is still configured for PostScript:

(%Use the same parameter set here as used in the previous code%)

<< /Protocol /Binary

/Interpreter /PostScript

>> setdevparams

If all available ports have been configured for HP LaserJet IIP emulation, returning to PostScript will require changing the push-wheel switch to one of positions 0 through 5.

TA48162_LaserWriter_IIf_IIg_EPROM_Wear_(TIL09828).pdf

LaserWriter IIf & IIg: EPROM Wear

Are there any concerns about writing to an EPROM in the LaserWriter IIf and IIg? (With the LaserWriter NT or NTX, there's a limit to the number of changes before it becomes worn out.)

This article has been archived and is no longer updated by Apple.
Unlike the LaserWriter IINTX, which uses battery backed nonvolatile RAM to store settings, the LaserWriter IIf and IIg use a device much like that in the LaserWriter IINT. But where the IINT is limited to approximately 10,000 writes, the newer device allows approximately 50,000. The LaserWriter IINTX has no such limit, but the battery within the memory device will eventually fail -- resulting in the same symptoms.

Published Date: Feb 18, 2012

PostScript Level 2: Doesn‘t Check for Device-Specific Operators

I upgraded from a LaserWriter IINTX to a LaserWriter IIg, to print jobs made by Sun workstations. Files that printed on the LaserWriter IINTX now fail to print on the LaserWriter IIg. The problem file generates a calendar for 1992. Examining a log shows that the "load" command isn't finding a key entry and causes the error. This is somewhere in the following PostScript extract:

"/a4 [[300 72 div 0 0 -300 72 div -72 3436] 292 3365
{statusdict /jobstate (printing) put 0 setblink
margins exch 142 add exch 256 add 8 div round cvi frametoroket
statusdict /jobstate (busy) put 1 setblink} /framedevice load
60 45 {dup mul exch dup mul add 1.0 exch sub} /setscreen load
{} /settransfer load /initgraphics load /erasepage load] cvx
statusdict begin bind end readonly def"

Is the software that creates the Postscript doing "unapproved" things to the statusdict dictionary? Or are the problems due to a change from Level 1 to Level 2 Postscript in the LaserWriter IIf and IIg?

This article has been archived and is no longer updated by Apple.
After a quick look at the CAL code, we noticed at least a couple of device-specific operators.

The first, framedevice, is the one causing the failure on your LaserWriter IIg. The framedevice operator no longer exists in PostScript Level 2 implementations. It wasn't included in a number of Level 1 implementations either. Nearly every mention of the operator in Adobe documentation warns about its use, all pointing out that the code should definitely understand the environment it's used on. It's interesting that an application is generating code that uses it without first verifying its existence on the printer.

The second problem operator is setblink. It actually occurs first in the code, but is in a deferred procedure and therefore doesn't get a chance to cause problems because it's never executed. (More on this later.) It's also device-specific to some printers that allow program control over the user indicator panel.

Finally, both of the problem operators are in a definition of the a4 paper size. This is the same segment you included in your question. What's almost humorous is that nothing in the rest of the code refers to this definition. It isn't used. (That's why the setblink operator never has a chance to fail.) Commenting out the a4 definition doesn't affect the program's operation or output. Also, a4 is already defined in many PostScript implementations. It certainly doesn't need to be redefined for the LaserWriter IIg. If the Sun generated this by a "prep" file, you should be able to comment it out to prevent causing further problems with other files.

In any case, the program that generated the PostScript should have first checked for the existence of these operators. The problem is showing up because of changes from PostScript Level 1 to Level 2, but the real culprit is the PostScript code itself. It fails to test adequately the environment it's running in.

Monitor II: Wavy display and voltage regulation

This article has been archived and is no longer updated by Apple.

When a Monitor II starts to exhibit a wavy display, it may be attributed to overheating of the voltage regulator, IC601, mounted on the heat sink near the power transformer. If a voltage check shows the voltage regulator to be good, it may only fail while hot. Apple's Quality Assurance reports have indicated that this failure is directly related to the mounting screw that secures the voltage regulator to the heat sink. If the screw is loose, there is inadequate heat transfer between the heat sink and the voltage regulator and it fails prematurely.

When servicing the Monitor II, insure that the IC601 mounting screw is secured.

If you replace the IC601, be sure to use thermal compound or an insulator pad (P/N 725-0006) between the IC601 and the heat sink.

DAL: How to Access Database on Remote VAX

We have some VAX systems running VAX/VMS. What logical names are required for DAL on one VAX to access an ORACLE RDBMS on the other VAX? We were able to run SQLPlus, but we've customized it so the access required a few logical names.
This article has been archived and is no longer updated by Apple.
If the VAX systems are part of a VAXcluster, you must connect to a node that is running the DAL Server and AppleTalk for VMS. If the DAL Server and AppleTalk for VMS has been licensed for each node on the VAXcluster, then you may access a shared database via DAL from any node running the DAL Server and AppleTalk for VMS.

If the VAX systems aren't part of a VAXcluster, you still can access the remote database, if the database is set up for remote access. ORACLE, Ingres, and Sybase all have mechanisms to support remote database access.

For example, if you have the DAL Server and AppleTalk for VMS installed on VAX A and the ORACLE database installed on VAX B, you can allow users on VAX A to access the database on VAX B in this way:

1) Select either the Async Driver, the DECnet Driver, or the TCP Driver for SQL*Net during ORACLE installation.

2) Create a database link for each database. This database link contains enough information to uniquely identify a path to the remote database. It normally contains the following information:

- Network protocol
- Nodename
- Dbname
- Username/password
- Protocol options

If the users on VAX A can access the database on VAX B, then the DAL Server has access, too. The database application handles the Async, DECnet or, TCP/IP communications between VAX A and VAX B, not DAL.

DAL: Protocols for NetWare SQL, Btrieve Hooks

What protocols support DAL for NetWare SQL? What pieces of NetWare, if any, must be co-resident? Are there hooks into Btrieve?
This article has been archived and is no longer updated by Apple.
The DAL Server NLM (NetWare loadable module) supports AppleTalk via ADSP. You can connect the Macintosh to any segment of the network (LocalTalk, Ethernet, Token Ring, and Arcnet). DAL for NetWare SQL uses hosts.cl1 or DAL Preferences file with the familiar syntax:

ServerName:atalk:ServerName.AppleTalkZone

Files required for the NetWare File Server side:

NetWare v3.11 or later
Mac.NAM v3.4
BTRIEVE.NLM v6.0 or later
NWSQL.NLM v3.0 or later
APPLETLK.NLM v3.01
TLI.NLM v3.11
DALSVR.NLM v1.0

NetWare SQL uses NetWare Btrieve as its record manager. Consequently, front-end DAL applications running on the Macintosh can share files created and maintained by the thousands of Btrieve applications already on the market.

DAL: Blyth DAL/DOS Client Software

What protocols are supported in the DAL/DOS client software from Blyth?

This article has been archived and is no longer updated by Apple.

Blyth Software's DAL for DOS and DAL for Windows support asynchronous connections to VAX and UNIX systems, Irma, and AttachMate EXTRA HLLAPI for 3270 connection to mainframes.

PowerBook: Don‘t Make Direct Calls to Serial Chip 2/92

We're using a PowerBook 170 with software we developed. This software accesses a serial device attached to the external serial port.

When we use the same software under System 7.0.1 on a Macintosh IIci, it works fine. When we attempt to use it on a PowerBook 170, the program bombs out and the serial ports lock up. The internal modem on the PowerBook 170 doesn't appear to be interfering. All settings seem correct.

What could be the source of this problem? Were there any changes to the serial port on the PowerBook 170 that might require some sort of special serial switch?

This article has been archived and is no longer updated by Apple.
It sounds like the application is making serial communication calls directly to the PowerBook 170's serial chip. An application should use normal communications calls to talk to the serial driver; it should never attempt to get direct access to the SCC hardware.

The serial chip is turned off when not in use (in order to conserve power). If your application makes normal serial communications calls, the serial driver knows how to turn the serial chip back on. However, an application that attempts to go directly to the serial chip will wind up talking to the chip when it's turned off, resulting in a loss of communication.

AppleWorks IIe: LaserWriter Interface

The following describes the connection between AppleWorks on the Apple IIe and LaserWriter.
This article has been archived and is no longer updated by Apple.

I. Apple IIe

1. Super Serial Card (SSC)

A. Circuit Configuration

Near the internal cable (Part 590-0021) of the SSC there is a removable block of pins with a triangle on its top face. Make sure this jumper block is plugged into its socket so that the triangle points to the word TERMINAL printed on the card.

This configuration, called modem elimination, compensates for the standard RS-232-C pin assignments so that the internal cable through the appropriate pins.

B. Install the SSC in Slot 1 of the IIe Motherboard.

C. SSC DIP Switch Settings

Switch 1	1	2	3	4	5	6	7
ON	-	-	-	X	-	X	X
OFF	X	X	X		X	-	-
Switch 2	1	2	3	4	5	6	7
ON	X	-	-	X	X	-	-
OFF	-	X	X	-		X	X

These switch settings are for:
Switch 1:
9600 baud (SW1: 1-4)
Printer Mode (5-6)
Normal Clear To Send (7)

Switch 2:
8 data bits and 1 stop bit (SW2: 1)
no delay after CR (2)
video off (3)
132 character line (4)
auto-LF after CR (5)
Disabled ACIA-CPU interrupts (6)
Normal Clear To Send (7).

No parity is set automatically in the Printer Mode.

II. The Connection

1. Cable
Serial and Communications Cable (Part 590-0037)

Cable Pinout:

Super Serial Card IIe Back panel DB-25 connector		Wiring	LaserWriter DB-25 connector	
signal	pin	<->	pin	signal
Frame Ground	1	<->	1	Frame Ground
Tx (Transmit Data)	2	<->	2	Tx (Transmit Data)
Rx (Receive Data)	3	<->	3	Rx (Receive Data)
RTS (Ready To Send)	4	<->	4	RTS (Ready To Send)
Signal Ground	7	<->	7	Signal Ground
DTR	20	<->	20	DTR

1. Levels from Super Serial Card:

a. True (asserted): 0 volts
b. False: +5 volts

III. Apple LaserWriter Printer

1. Set the Selector Switch on the LaserWriter to "Special", which can be done without turning off the printer. In Diablo 630 emulation mode, the LaserWriter uses 9600 baud, XON/XOFF protocol, and no parity.

2. Check

To verify the connection, turn on the IIe, video monitor, and LaserWriter. Boot AppleWorks and choose "Other Activities" from the Main Menu. Add a custom printer, naming it LaserWriter. Use these settings for this custom printer:

Needs line feeds after each Return	No
Accepts top-of-page commands	Yes
Stop at end of each page	No
Platen width	8.0 inches
Interface cards	Control-I 80N Control-I X space E^
Printer codes	Yes

The printer codes for the Diablo Emulation are in the LaserWriter Technical Description. If you specifiy no printer codes, the typeface will default to Courier standard, 12 characters per inch, monospaced.

Return to the Main Menu and try to print a document.

Note: When you use the AppleWorks command Open-Apple-H for hard copy, you will have to print a document using Open-Apple-P before you may use the Open-Apple-H command again. This is because the command Open-Apple-H does not issue the form feed the LaserWriter needs to output the last page and clear its Diablo emulation settings.

PowerBook Fax/Data Modem: How Escape Sequence Differs from Hayes

I'm reluctant to believe that the PowerBook internal modem is fully compatible with Hayes' patented guard time escape sequence. Is this a serious issue?

This article has been archived and is no longer updated by Apple.
The issue relates to the different ways the escape sequence is implemented by Hayes and Apple. The primary difference is that Hayes implements a guard time and Apple doesn't. And no, it isn't a serious issue.

Background

You can use an escape sequence when the modem is on-line and you need to enter commands to the modem, but you don't want to disconnect from a call. The escape sequence ensures that you won't lose the modem connection or data while the modem is off line in the command state. Because of the escape sequence, modems can provide reliable transmission of data, distinguishing the predetermined escape sequence characters from the random occurrence of like characters in user data.

Hayes' Implementation

To enter the escape sequence, follow these steps:

1) Pause 1 second (Hayes calls this the guard time) or longer.

2) Enter +++ (3 plus characters), and pause 1 second or longer.

3) The "OK" from the modem acknowledges that it has escaped from the on-line data state, and you may begin entering AT commands.

When you're ready to resume your call to a remote system, enter ATO, and press RETURN. This is the command to return on-line.

Apple's Implementation

There are two ways to enter into the command state while on line:

- Send a BREAK to the modem (refer to the ATYn command on page 100 of the Macintosh PowerBook Fax/Data Modem User's Guide for more details), and it will immediately drop into command state, or

- Enter the appropriate escape sequence.

The following strings are recognized as valid escape sequences:

+++ATxxx....xxx<CR>
+++<CR>ATxxx....xxx<CR>

<CR> is RETURN.
xxx....xxx is a character string consisting of 0 to 13 ASCII characters.

After the escape command is recognized and executed, the modem sends an OK result code.

NOTE: This escape sequence is only based on character recognition, regardless of any guard time before, during, or after the DTE sends the string to the modem. This command isn't recognized in command mode.

System 7: Modifying the Keyboard Layout Switching Command

Under System 7.x, I can switch keyboard layouts by pressing the Command-Option-Space Bar keys. This feature is probably not well known in the U.S., where normally only one keyboard layout is installed. However, in most European countries you may have at least two keyboard layouts installed.

In Norway we have three: two different Norwegian (only one key is different) and the U.S. keyboard layout. The ability to change keyboard layouts in environments with employees from different countries is appreciated. And with the Keyboard menu (between the Help menu and the Application menu) enabled with a little help from ResEdit, it's very easy to find the keyboard layout in use.

Many heavy users in the graphics business have upgraded to System 7.x, or bought Macintosh Quadra systems. The keyboard layout switch shortcut causes issuess in some common graphics applications such as Adobe PhotoShop, Adobe Illustrator, and Quark XPress.

Adobe PhotoShop and Adobe Illustrator use the Command, Option, and Space Bar sequence to zoom the picture in, while Quark XPress uses this sequence to get a special space character called em-space (used a lot among professional typographers).

We've found a workaround with PhotoShop and Illustrator. If we press the Space key before the Command and Option keys, the keyboard layout won't change. The Quark XPress issue is more difficult, since the Command, Option, and Space Bar sequence displays a special character, rather than executing a command.

Do you have any solutions for this?
This article has been archived and is no longer updated by Apple.
Note: System 7.5 comes pre-installed with many keyboard layouts. Also, if a System 7.5 Easy Install is performed, all the European keyboard layouts are installed as a default. The user can limit the keyboard layout installation to only the U.S. keyboard layout if a Custom Install is performed. For more information about workarounds and alternatives to using ResEdit see the following article: "System 7.5: Command-Option-Spacebar Application Conflict"

WARNING: The following instructions refer to using ResEdit to alter your system software. Apple Computer, Inc., is not liable for any damage done to your software through the use of ResEdit to alter the software.

The entries in the 'KSWP' system resource (ID = 0) control the switching of the keyboard layouts. Actually, the entries in the 'KSWP' resource control more than that. Inside Macintosh Volume VI fully documents this resource on pages 14-43 to 14-44, and pages 14-98 to 14-99.

The standard U.S. 'KSWP' resource looks like this:

```
FFFF 3101 FFFC 3109
FFFE 4601 0000 4201
0000 0000
```

Each long word entry controls a separate function. The first two bytes (integer) form the verb that the KeyScript procedure will act upon. The third byte is the virtual key code for the key that you must press, and the fourth byte is the modifier state that must exist when you press the key.

Table 14-3 on page 14-44 of Inside Macintosh Volume VI outlines the verbs for the KeyScript procedure.

You can find most of the virtual key codes on pages 191 and 192 of Inside Macintosh Volume V, or by using ResEdit on the 'KCHR' resource in the System file.

Note on modifier state: Option key down is equal to 8; Shift key down is equal to 2; and Command key down is equal to 1. If you press multiple modifier keys at the same time, their values are added together for the modifier state entry.

The second entry in the standard U.S. 'KSWP' resource (FFFC 3109) is the one that causes the problems you describe. The first two bytes, $FFFC or -4, form the verb "smKeyNextKybd" which means "Switch to next keyboard in active script." The third byte, $31, is the virtual key code for space. The fourth byte is Command key down (1) plus the Option key down (8) which equals $09.

There are three ways to solve the problem. The first method is rather limiting and not very flexible. The second is the most straightforward, and probably the best. The third is the most flexible, but the most complicated from a user's point of view.

- Delete the entry that causes the issue.
The 'KSWP' resource would then look like this:

```
FFFF 3101 FFFE 4601
0000 4201 0000 0000
```

- Change the virtual key code to something other than $31.
Changing it to $4C would allow the Command-Option-Enter key sequence to switch keyboard layouts. The 'KSWP' resource would look like this:

```
FFFF 3101 FFFC 4C09
FFFE 4601 0000 4201
0000 0000
```

- Add two new entries to the 'KSWP' resource.
One would disable switching from the current keyboard (verb "smKeyDisableKybdSwitch") and the other would enable keyboard switching (verb "smKeyEnableKybds"). Command, Option, and Enter disable switching, and Command, Option, and Return enable switching. The 'KSWP' resource would look like this:

```
FFFF 3101 FFFC 3109
FFFE 4601 0000 4201
FFF4 4C09 FFF9 2409
0000 0000
```

Note: The four bytes of zeroes at the end of the resource are filler and must be present.

LaserWriter IIg: Link Signals on 10Base-T

I'm testing a LaserWriter IIg on a Banyan network. I'm using a twisted pair transceiver. In my network environment and a variety of vendor equipment, I can't have equipment sending out any "Link signals" between networking components. It appears the transceiver is emitting some sort of link signal. Is there any way I can turn off this signal?

This article has been archived and is no longer updated by Apple.
There isn't an option to turn off the "link beat" signal on the Apple Ethernet NB cards or the LaserWriter IIg when using the 10Base-T transceivers. The "link beat" signal is part of the 10Base-T standard. The cards are designed for use on 10Base-T compliant networks only, and no provisions have been made to accommodate any non-standard Ethernet configuration.

One possible solution, Asante's 10T MAU (medium access unit), allows any computer with a thick Ethernet port to connect to a 10BaseT twisted-pair network. The device, which resembles an external modem, contains two ports:

- A 15-pin AUI port for a thick coaxial connection, and

- An eight-pin RJ-45 port for connection to twisted-pair cable.

The 10T MAU unit also provides four LED status displays and two switches that enable or disable the link integrity and SQE signals. The device is compatible with any thick-cable Ethernet card. You could use this device in addition to an Apple Ethernet NB card with the thicknet transceiver option.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

Macintosh Quadra: No Way to Disable DRAM Tests

Is there a way to reduce the time it takes for a Quadra with a large amount of RAM to perform its RAM tests on startup? A Quadra 900 with 128MB of RAM takes 86 seconds to access the hard drive; a Quadra 700 with 68MB of RAM takes about half the time.

Is there a key combination we can use on startup to bypass the RAM tests?

This article has been archived and is no longer updated by Apple.
You can't defeat the startup RAM test without installing new ROMs having a different startup sequence.

A/UX: Can Mount and Use AppleShare Volumes (9/94)

Can I mount AppleShare volumes under A/UX? Can I then manipulate files?
If so, how does A/UX handle filenames with blanks in them?

This article has been archived and is no longer updated by Apple.
Yes, A/UX mounts any AppleShare volume in the AppleTalk network on your desktop. A/UX 3.0 can also do Macintosh File Sharing as in Macintosh System 7.0. It can export any volume from your A/UX computer to be shared in the AppleTalk network. (Note that AppleShare SERVER functionality isn't supported under A/UX.)

The A/UX File Manager handles all files, including A/UX file systems (BSD and System V file systems) and Macintosh HFS (Hierarchical File System) without any problem. This, of course, includes handling file format conversion and copy between different file systems, file permission, and filenames with blanks. As a matter of fact, UNIX is capable of creating filenames with blanks, for example:

% touch "This Is Mine"

A/UX: Remove Temp Files On Unsuccessful adduser Command (8/94)

I've just set up a server with A/UX. Everything works until I add a new user with the adduser command. I get the reply, "File busy, try again later."

Now I can't change passwd for anyone. I can login and logout as root, edit the /etc/passwd, and modify it with vi, but not with vipw. I can't change my own passwd as root with passwd command. I've even replaced /etc/passwd by /etc/opasswd, and still nothing has changed. I've also restarted the computer twice. I've changed all the privileges, and even changed the file by a user other than root.

I'm NOT running yellow pages (NIS), just networking with NFS, telnet, and so on.

This article has been archived and is no longer updated by Apple.
You probably had an UNSUCCESSFUL attempt using the adduser command. The "vipw" may have incorrectly set the user password. In turn, it created two locked file called "ptmp" (password temp file), and "gtmp" (group temp file) in the /etc directory.

Removing the /etc/ptmp and /etc/gtmp locked files should take care of your problem.

A/UX: HoneyDanBer (BNU 1) UUCP (9/94)

I'd like to have this information on UUCP under A/UX 3.0:

- What are the main differences between BNU UUCP and A/UX 2.0 UUCP?

- What is f-protocol in BNU UUCP?

This article has been archived and is no longer updated by Apple.
Basically, the HoneyDanBer UUCP is a well-known UUCP implementation in the UNIX community. Its overall performance with A/UX 3.0 is better than the one we used in A/UX 2.0.1 and before. These are the differences:

- It supports TCP as well as serial links.

- The file structure of the UUCP system files under /usr/lib/uucp directory are organized differently (new files and new formats).

- It adds more parameters and features for better control on dialers and login checking sequence.

- Almost all the files (for example, Devices, Sysfiles, Systems, and so on) in the /usr/lib/uucp directory have new formats.

- The new A/UX Network System Administration document for A/UX 3.0 describes more details.

The original HoneyDanBer UUCP didn't include the f-protocol. Because of requests for the f-protocol, A/UX 3.0 adds it in the HoneyDanBer UUCP.

The f-protocol is a UUCP protocol used to communicate over X.25 networks. The PAD dialer is a "real" dialer used to set up connections to remove X.25 destinations using MICOM or Motorola PADS, and will probably work on most other PADS.

MacX: Iconified Windows Can‘t Be Animated

We're trying to provide a mail program that, when iconified, will change icons to show incoming mail and/or incoming files. But when we iconify windows in MacX, the iconified window can no longer update the icon to show changes in window status.

This article has been archived and is no longer updated by Apple.
The built-in MacX Window Manager doesn't support the window animation after the window has been iconified. In other words, all iconified icons become inactive until de-iconified.

However, other window managers, such as "twm," support this feature even if the client has been iconified. The icon still does animation as it is in the regular window. For example, the "kalaid" client under "twm" demonstrates this capability.

We suggest that you run the client under your favorite window manager.

System 7: Lost "Get Info" Comments

Article Change History

12/16/92 - UPDATED
* To report System 7.1 has the same problem.

When I insert a floppy disk and choose Get Info, I can type comments. When I eject and reinsert the floppy disk, the comments are gone. I can also reproduce this by leaving the floppy disk inserted, using NoFinder to kill the Finder, and then relaunching the Finder. This is true for System 7.0 and 7.0.1 (both with and without Tune Up).

This article has been archived and is no longer updated by Apple.
This problem with SuperDrive (FDHD) disks has been reported to Engineering and to the System 7 team. We don't have a workaround yet but can duplicate it with System 7.0, 7.01 and 7.1.

Published Date: Feb 18, 2012

System 7: Does Not Support Non-SCSI Hard Drives

I am using an old HD20 (pre-SCSI disk from a Macintosh 512K) with a Macintosh Classic running System 7. The disk gets corrupted. Is it impossible to use HD20 with System 7?

This article has been archived and is no longer updated by Apple.
System 7 requires a SCSI hard drive. The Non-SCSI HD20 is therefore not supported by System 7.

PowerBook: Using External Device to Discharge NiCad Battery

When using an external discharge device to discharge the NiCad battery in a PowerBook, is there any adverse effect on the hardware or internal lithium battery?

This article has been archived and is no longer updated by Apple.

There should be no issues using an external discharge device to discharge and then recharge a the NiCad battery in a PowerBook 140, 145, 160, 170, or 180.

Note: This should NOT be done, however, with a PowerBook 100 or PowerBook Duo, which do not have a NiCad battery.

Published Date: Feb 18, 2012

Macintosh Display Cards 824 & 824 GC: Rev A/B Differences

Why doesn't the ROM upgrade to the Macintosh Display Card 8*24 GC Rev A allow 16-bit color on the Macintosh 16-inch Color Monitor? What is the difference between an upgraded Rev A card and the Rev B card?

Also, why doesn't the Macintosh Display Card 8*24 support 16-bit color on the Macintosh 16-inch Color Monitor?

This article has been archived and is no longer updated by Apple.
Although the ROM upgrade for the Rev A 8*24 GC card allows this card to work with the Macintosh 16-inch Color Monitor, the ROM version isn't the only difference between the Rev A and Rev B 8*24 GC cards. The Rev B card includes a new CLUT/DAC chip that supports a 16-bit color lookup table that is necessary for 16-bit color support. Because this chip isn't available on the Rev A card, this card won't support 16-bit color.

Similarly, since the 8*24 card doesn't have a CLUT chip that supports 16-bit color, this card won't provide 16-bit color support. However, just like the 8*24 GC, you will need to upgrade the ROMs on older versions of this card if you wish to use a Macintosh 16-inch Color Monitor.

AppleWorks: Printing Forms from the Database or Word Processor

Some Appleworks printing jobs have a page length less than 11 inches for continuous tractor-feed envelopes or mailing labels.

With data base documents, most users define the page length from the printer options menu in each "Print a report" format (OA-O) of the database document that contains the label text.
This article has been archived and is no longer updated by Apple.
Follow these steps:

1. Choose the data base document you want to print.

2. Press OA-P, choose a label report format, and then press OA-O. You're now in the Printer Options Menu.

a. Type PL (Paper Length). Enter a value equal to the vertical length, in inches, of a single form. Many labels are 1.0, 1.5, or 3.5 inches high; Appleworks accepts all these values as paper lengths.

b. Set the options PH (Print Header) and OM (Omit Line) to NO by typing the two letter code until the option reads NO.

With word processor documents, however, there are a few additional parameterss you must control in order to produce acceptable results when printing continuous forms:

(1) automatic top and bottom margins
(2) form feeds.

Unless you take care to control these two parameters properly, the printer will usually produce documents that are either badly printed or altogether blank.

To avoid these problems, do the following:

1. Choose the word processor document you want to print.

2. Press the OA-O. This gets you to the Printer Options Menu.

a. Type PL (Paper Length). Type a single form's vertical length in inches. Many labels are 1.0, 1.5, or 3.5 inches high; Appleworks accepts these values as page lengths.

b. Make sure the Top and Bottom Margins are zero.

3. From the main menu, select item number 5, "Other Activities". This selection will display a menu with 7 items.

4. Select item number 7, "Specify information about your printer(s)". This displays a menu entitled "Printer Information".

5. Under the heading "Change printer specifications" you will find one or two printer names. Select the name of the printer you want to use.

6. Change item number 2 ("Accepts top-of-page commands") to NO.

AppleWorks will now print using the page length you defined in the printer options menu.

Sys 7: AppleShare 3.0 Print Server Print File Limits

Can the AppleShare 3.0 Print Server handle very large (for example, 60MB) print files?

This article has been archived and is no longer updated by Apple.

Theoretically, there are no limits on how large a print file can be -- you are limited only by the available disk space on the server. However, if a client Macintosh has background printing turned on, PrintMonitor may not be able to handle such large files. If that should happen, the workaround is to spool the document to the server with background printing turned off.

System 7: MacroMaker Is Not Supported

Article Change History

09/02/92 - REVIEWED
* For technical accuracy.

In the compatibility listing I have for system software version 7.0, it says that MacroMaker is "unnecessary". This seems to indicate that System 7 somehow does macros, but I can't find anything on this in the manuals.

This article has been archived and is no longer updated by Apple.
"Unnecessary" was a poor word choice. It should have stated that MacroMaker was "not compatible". MacroMaker is not supported in version 7.0, and there are no plans to revise it for version 7.0 compatibility.

There are several third-party macro products that are compatible with version 7.0, including QuicKeys 2 by CE Software.

For more information, search on CE Software.

Published Date: Feb 18, 2012

Macintosh: Using System 7 on HD and Earlier Version on Floppy

I upgraded my Macintosh hard drive to system software version 7.0, but I have some programs that are not version 7.0 compatible that I'd still like to use. Can I start up my Macintosh from a floppy startup disk that is running system software earlier than version 7.0 and use those programs?

This article has been archived and is no longer updated by Apple.
Yes. You can start up from a system software version 6.0.X startup floppy disk, provided that the Macintosh doesn't require version 7.0.1 or later to run. The Macintosh Classic II, Macintosh PowerBook series, and Macintosh Quadra series do not support system software version 6.0.X.

Note

Version 6.0.X does not recognize the version 7.0 desktop file. When you first start up from the version 6.0.X floppy disk, a dialog will appear reporting that the version 7.0 hard drive is damaged and asking if you want to repair it. (Your hard drive is not damaged.) Click the "OK" button, to create the version 6.0.X desktop file.

The next time you start up from the version 7.0 hard drive, the system software will update the version 7.0 desktop file for any changes that were made during the version 6.0.X operation.

PowerBook: Battery Recharger Properties

This article contains information about the Macintosh PowerBook battery rechargers?
This article has been archived and is no longer updated by Apple.
The PowerBook battery recharger does not provide just a bulk charge to the NiCad batteries. The sophisticated power circuitry within the recharger assists in preventing NiCad battery "memory" problems by monitoring the battery levels and adjusting the charge appropriately.
Published Date: Feb 18, 2012

LaserWriter IINT Manual Feed: Why Paper-Out Light Stays Lit

When I print from the manual-feed tray on my LaserWriter IINT, the paper-out status light stays lit. I can still print from the tray without any problem, but the only way I can clear the status light is to open and shut the printer cover.

This article has been archived and is no longer updated by Apple.
There is a bug in the LaserWriter IINT ROM that causes this. If you have a piece of paper in the manual-feed tray when you issue a manual-feed print job, the status light stays on after the print cycle. The workaround is to send the manual-feed print job, then wait until the status light is blinking before you insert the piece of paper.

There is no other workaround for this problem, and none is planned because it is a cosmetic problem and does not affect the actual operation of the printer.

PowerBook: Using AppleTalk Remote Access with Internal Modem

How do I configure AppleTalk Remote Access to use my Macintosh PowerBook 170 internal modem? There is no option in the AppleTalk Remote Access Setup to choose the internal modem.

This article has been archived and is no longer updated by Apple.
You need to configure both the AppleTalk Remote Access Setup and the Macintosh PowerBook Portable control panel to use the internal modem.

1) In the AppleTalk Remote Access Setup, select the Modem port.

2) From the Apple menu, choose Control Panels and select the Portable control panel.

3) In the Portable control panel, you have the option to set the serial port for either the external or internal modem. Set the port for the internal modem (note that this will disable the external serial modem port).

PowerBook: To Send Fax, Hard Drive Must Be Up to Speed 1/96

I am having intermittent problems staying connected to Fax machines from my Macintosh PowerBook 170 Fax/Data Modem. I have checked my configurations; I am sending to a known-compatible Fax machine; and I am using a clean phone line.

This article has been archived and is no longer updated by Apple.

If the PowerBook hard drive has been spun down, and you try sending a Fax before the hard drive is fully spun up, the PowerBook it will be able to make the connection. However, while the hard drive is in the process of spinning up, the Fax/Data modem in unable to send any data even though it is connected. This will cause the receiving Fax machine to detect this call as a "No Carrier" and it will disconnect.

A workaround you can try is to configure the Portable (or PowerBook) control panel so that the hard drive will not spin down. To do this:

Step 1

Choose Control Panels from the Apple menu.

Step 2

Select the Portable (or PowerBook) control panel.

Step 3

Hold the Option key while you click the minutes option, and set it so that the hard drive will not go into the sleep state.

Note

If you are running your PowerBook computer from the battery, doing this will reduce the operational time of the battery because the hard drive will not go spin down, therefore it will always be drawing power. If you are running from the battery, we suggest that you reset the Portable control panel minutes option for the hard drive to spin down after you send the Fax.

TA48201_Lisa_Boot_ROM_Versions_(TIL00987).pdf

Lisa: Boot ROM Versions

This article has been archived and is no longer updated by Apple.
Many users have received notices telling them that they must upgrade to Rev. H CPU ROMs to run Pascal 3.0. THAT NOTICE WAS IN ERROR! Acceptable ROM versions include:

Lisa 2: D/A8 or H/A8
Lisa 2/10: F/88 or H/88

--The first (alphabet) character indicates the revision of the CPU ROM; the following two characters identify the I/O ROM.

Other CPU ROM versions, such as A, B, C, E and G, should definitely be upgraded. If a user insists on Rev. H CPU ROMs, or if you need to upgrade old CPU or I/O ROMs, order them from your Apple Regional Service Center. The part numbers are:

CPU ROMs	I/O ROM
Lisa 2: 341-0175, 341-0176	341-0290
Lisa 2/10: 341-0175, 341-0176	341-0281

NOTE: The ROM versions are both stamped on the chip itself and displayed in the upper right corner of the Lisa's screen when you boot the system.

Apple 5.25 Drive: Macintosh Compatibility (5/97)

Is the Apple 5.25 Drive compatible with the Macintosh IIsi?

This article has been archived and is no longer updated by Apple.

No. Support for the Apple 5.25 Drive was discontinued when Apple started implementing the FDHD ROMs. This means that the Apple 5.25 Drive is compatible with only the Macintosh SE (800K drives) and Macintosh II (800K drives).

We suggest that you research third-party solutions; for example, DaynaFile from Dayna Communications.

System 6: Memory Errors Under MultiFinder 2/93

Article Change History

02/02/93 - REVISED
* To indicate that this is valid for System 6 only.

I am often asked by Macintosh users running MultiFinder what causes these types of error messages:

- Application has unexpectedly quit (2)
- Not enough Finder memory ...

This article has been archived and is no longer updated by Apple.
In most cases, these error messages appear when there isn't enough memory allocated to the Finder when running under MultiFinder.

When you are running in Finder only, the Macintosh allocates all available memory to the Finder until an application is run. When you are running under MultiFinder, the Finder is treated as an application and is given a set amount of memory to work with.

To determine if your problem is insufficient memory allocated to the Finder when you are running under MultiFinder, restart your Macintosh in Finder only mode. Then try the same function that resulted in the error message. If you don't get the error message, you need to increase the memory allocated to the Finder when you are running in MultiFinder.

How To Increase Finder Memory Allocation
---
1) Start up your Macintosh in Finder only mode.

2) Open the System Folder of the startup disk, and click the Finder file.

3) From the File menu, choose Get Info (or simply press Command-I on the keyboard).

4) In the Get Info window, increase the amount of memory shown in the Application Memory Size box. Note that any additional memory that is allocated to the Finder will not be available to applications. A good starting point is to increase the memory allocation by 100K.

Farallon StarController: Specifies One Node per Port

I have a Farallon PhoneNET StarController and a Farallon punch-down block. Can I punch down four nodes per channel on the punch-down block; that is, can I daisy-chain at the block instead of at the Macintosh end?

This article has been archived and is no longer updated by Apple.
The Farallon StarController specifies one node per port. Exceeding this limit may cause network traffic and/or termination problems.

We suggest that you contact Farallon Technical Support for further information.

Macintosh Portable: Can Be Used Without Internal Hard Drive

I have a Macintosh Portable that I use with an external hard drive. Will the Macintosh Portable operate properly if I disconnect the internal hard drive?

This article has been archived and is no longer updated by Apple.
The Macintosh Portable operates properly without an internal hard drive. The Macintosh Portable does not provide termination power; therefore, an internal hard drive is not required.

The modification you're suggesting is often used in secure environments to ensure that storage media are not transported to unsecured areas.

Note

Because the Macintosh Portable is sensitive to ESD damage, this or any other modification must be done by an authorized Service Provider.

StyleWriter: Apple vs. Third-Party Ink Cartridge (1/95)

I have been using standard Canon ink cartridges with my StyleWriter printer. An Apple technician told me that using non-Apple StyleWriter Ink Cartridges voids Apple's warranty on the StyleWriter.

Is this true?

This article has been archived and is no longer updated by Apple.
Apple StyleWriter Ink Cartridges (M8041G/B) are made by Canon for Apple and meet Apple's rigid specifications.

Physical damage to the printer caused by the use of a third-party printhead cartridge or ink refill kits that DO NOT meet Apple's rigid standards WILL void the warranty.

Although not supported by Apple, the use of Canon, third-party cartridges, or ink refill kits that meet the rigid specifications WILL NOT void the Apple warranty. For best print quality, Apple recommends using the Apple StyleWriter Ink Cartridges for the orignal StyleWriter and StyleWriter II.

Macintosh LC with Apple IIe Card: Copying ProDOS Disks and Files

I have a Macintosh LC with an Apple IIe Card installed and an Apple 5.25 Drive connected to the card.

1) Can I disk copy a 5.25-inch disk to a 3.5-inch disk in the Macintosh LC SuperDrive?

2) How do I make a disk copy of a 5.25-inch disk?

This article has been archived and is no longer updated by Apple.
1) No, you can't do a disk copy because you can't copy from one size disk to another size disk. You need to copy individual files from the 5.25-inch disk to the 3.5-inch disk. The ProDOS utilities can be used to do this.

Another problem is that some disks may be in the older DOS 3.3 format, which is not supported on the higher-density disks. Though ProDOS will read DOS 3.3 disks, and you can copy DOS 3.3 files to ProDOS, some programs will not run because of operating system differences.

2) To copy standard a 5.25-inch disk with the Apple IIe Card and one Apple 5.25 Drive, use the ProDOS utilities, which provide a copy function. You need to specify the same device for both the original and duplicate. The software prompts you when you need to insert and remove disks. Note that some disks cannot be copied because they are protected.

ProDOS Assembler Tools: Startup Sequence

The ProDOS Assembler Tools disk doesn't start up exactly as described on page 15 of the manual. What is the problem?
This article has been archived and is no longer updated by Apple.
When an Apple II starts up, it looks for a file named PRODOS. After it finds and loads PRODOS, it runs the first file on the disk that has the suffix .SYSTEM in its name. On the ProDOS Assembler Tools disk, the first such file is BASIC.SYSTEM, but the one needed is EDASM.SYSTEM.

Here's how to change the name of BASIC.SYSTEM so that EDASM.SYSTEM gets loaded first:

1. Make a copy of the ProDOS Assembler Tools disk.
2. Start up from the new disk.
3. When the Applesoft] prompt appears, type the following, pressing Return after each line:

```
] UNLOCK BASIC.SYSTEM
] RENAME BASIC.SYSTEM,BASIC.SYS
```

4. Either restart the system, or type the following to start the assembler:

```
] -EDASM.SYSTEM
```

This tells BASIC.SYSTEM to load and run EDASM.SYSTEM. ProDOS Assembler Tools now starts up, as described in the manual.

Lisa 7/7: Problems printing proportional-spaced fonts on a DWP

This article has been archived and is no longer updated by Apple.
Printing your Lisa 7/7 document in a proportional-spaced (PS) font, such as 12 Point, will yield the following results:

A. If you're using a standard "fixed" printwheel, characters such as "w", "m" and "r" will be oddly spaced.

B. If you're using a proportional-spaced print wheel, such as the Apple Modern 10/12 PS Printwheel, the odd spacing will be less apparent.

You can eliminate the odd spacing entirely by selecting a fixed pitch, such as 12 Point-15 Pitch, and using a fixed pitch printwheel, such as the Prestige Elite Printwheel.

Macintosh 512K: Upgrade to Macintosh 512Ke Was a ROM Swap

Are there any differences between an Apple-sold Macintosh 512Ke and Macintosh 512K upgraded to a Macintosh 512Ke?

This article has been archived and is no longer updated by Apple.
There should be no differences between the two, whether the Macintosh 512Ke came from Apple in that configuration or if it was done as an upgrade. The Apple upgrade was a ROM swap from 64K ROMs to 128K ROMs from the Macintosh Plus, and the most significant change was support for the Apple 800K floppy drive.

The only possible difference is that the upgrade didn't include the 800K floppy drive, although this is unlikely because that was the main reason for the upgrade. Every Macintosh 512Ke shipped from Apple had an 800K floppy drive installed.

System 7: Error -199 Is "Map Inconsistent with Operation"

I'm running system software version 7.0 on my Macintosh, and I got the message Error -199 message. What does it mean?

This article has been archived and is no longer updated by Apple.
Error -199 is a "Map Inconsistent with Operation" error. The most common cause of this error is corruption within the System file.

Our recommendation is to trash the System file and rerun the Installer to install a clean System file.

Published Date: Feb 18, 2012

System 7: Has Bad-Sector-Checking Mechanism for Floppy Disks

System software version 7.0 seems to have a floppy disk formatting feature that I haven't seen before.

If I format a new disk -- or reformat a previously used disk -- with the "Erase Disk" option and the formatting is successful, there is a "Verifying Format" function before "Creating Directory" appears. The boot blocks and data space are filled with the pattern F6F6.

If the formatting fails part way through the process, and I try to format again and it's successful, there is a "Re-verifying Format" function and the pattern is PKKT.

I also noticed on some floppy disks, which I've reformatted several times with the "Erase Disk" option, that the amount of disk space available decreases, even though there are no files on the disk except the Desktop file. I checked and there was a problem with some of the sectors. These bad sectors showed zeros, while the rest of the disk had the PKKT pattern.

This article has been archived and is no longer updated by Apple.
There is a bad-sector-checking mechanism for floppy disks in version 7.0, and it is that mechanism that is using up the disk space.

The "Re-verifying Format" message indicates that there was a problem during the first format attempt (a media failure was found on the floppy disk). Most floppy disks don't exhibit this behavior. Any that show the "Re-verifying Format" message multiple times would be suspect. You would most likely find more and more problem sectors with the zero pattern as the system tries to keep the floppy disk usable.

3.5" 160MB HDA: Designed for Specific Computers, Not LaserWriter

I'm trying to use an Apple 3.5-inch, 160MB HDA from a Macintosh Quadra 900 in an Apple external case with my LaserWriter IINTX.

The drive works fine when connected to a Macintosh system, but it isn't recognized by the LaserWriter IINTX. I can successfully use another drive with the same cables and terminator with the LaserWriter IINTX.

I am using LaserWriter Utility 7.0 to access the printer.

This article has been archived and is no longer updated by Apple.
All drives manufactured by Apple must conform to certain specifications, which the 3.5-inch, 160MB drive does. However, the 3.5-inch, 160MB drive was designed and tested to work ONLY in these Macintosh models:

- Macintosh Quadra 700
- Macintosh Quadra 900
- Macintosh IIfx
- Macintosh IIci

Many times Apple Engineering, Service, and Marketing decide to ship products in certain configurations based on availability, pricing, and technical specifications (such as Term Power, Power Draw, and so on). Keeping this in mind, it is important to use and/or order the correct part for the corresponding Macintosh system. Apple drives are not to be used in systems other than those for which they were originally intended.

System 7: Use CMS SCSI Utility INIT 7.0.2e or Later

I have a Macintosh PowerBook 140 with an internal hard drive running system software version 7.0.1. I am trying to connect a Syquest SCSI removable drive running CMS SCSI Utility 5.6, but the Syquest drive will not start up.

I had the same problem with the Syquest drive when I tried to connect it to a Macintosh PowerBook 170; however, the Syquest drive works fine with my Macintosh II and Macintosh IIfx.

This article has been archived and is no longer updated by Apple.
CMS Enhancements has a new CMS SCSI Utility INIT (7.0.2e) to use in conjunction with the CMS SCSI Utility software, which allows a removable SCSI drive to run on a version 7.0.1 system. Since the Macintosh PowerBook series require version 7.0.1, I assume that the Macintosh II and IIfx configurations worked because they have system software versions earlier than 7.0.1 installed.

Note that CMS Enhancements has released a new version (7.0.2) of the CMS SCSI Utility software. However, it is not mandatory that you upgrade to this version because the new CMS SCSI Utility INIT 7.0.2e is backward compatible with other versions of the utility software.

On AppleLink, you can find contact information on a company mentioned in this article by clicking the "Library Index" button in the lower-center of the Tech Info Library search window, then opening the "Third Party Company Directory" folder.

Tulin Hermit Crab Drive: Compatibility w/ Macintosh LC, Classic

I have a Tulin Corporation Hermit Crab external hard drive that uses power from the external floppy port of the Macintosh. I can use the drive with a Macintosh Plus, but it won't work with a Macintosh Classic.

Is there a known compatibility problem with this hard drive and the Macintosh Classic?

This article has been archived and is no longer updated by Apple.
Tulin Corporation is aware of a problem. Apparently, when the older version of the Hermit Crab drive is connected to a Macintosh Classic or a Macintosh LC, it does not spin up properly. Tulin indicated that the problem is related to the amount of power the drive draws from the Macintosh (12 watts).

Tulin does have a version of the Hermit Crab drive that works with the Macintosh Classic and Macintosh LC. Contact them directly for more details.

On AppleLink, you can find contact information on a company mentioned in this article by clicking the "Library Index" button in the lower-center of the Tech Info Library search window, then opening the "Third Party Company Directory" folder.

Material Safety Data Sheets: General Information

This article provides general information about, and a discussion of, Material Safety Data Sheets -- commonly known as MSDS.
This article has been archived and is no longer updated by Apple.
A Material Safety Data Sheet is an occupational safety and health document. State and federal law requires the manufacturer, importer, and distributor of any chemical substance used in a workplace to provide Material Safety Data Sheets along with the first shipment of that substance. The law also requires employers that use chemical substances to keep the MSDS on file and train employees in their use. An MSDS contains physical, chemical, and health- and safety-related information about the chemical substance.

The law does not require MSDS for everything used in a workplace setting. For example, you will not find MSDS for your pencils or pencil sharpeners. The law exempts any "article" that does not release hazardous substances under conditions of normal use from the MSDS requirements.

Despite this legal exemption, some companies routinely demand MSDS for everything they buy. In some companies, provision of MSDS is a standard purchasing contract term. To satisfy this demand, some of our vendors (but not all) routinely prepare MSDS for whatever they make and are available for the asking.

Apple maintains a list of MSDS for Apple Printer cartridges at:

Laser Printers: http://www.apple.com/about/environment/use/msds/laserprinters.html

Ink-jet Printers: http://www.apple.com/about/environment/use/msds/inkjetprinters.html

If the MSDS for the product you own is not listed at the Web addresses above, contact Apple technical support for information on availability.

LaserWriter: Printing Bold Characters from VAX

I'm using a Quadra and Microphone II (version 4) to dial into All-in-One on a VAX. It works great, my screens look good, I can use PF keys, and so on. However, when I print to the LaserWriter IINT, anything that was bold prints out on 2 lines. I assume that it is doublestriking the line to get the bold effect, not realizing it's a LaserWriter image-based printer. The LaserWriter is connected to the Quadra.

Do you know of any drivers that would let the printer know what it's doing? Do you think Microphone would? Could I use the PATHWORKS printer drivers without installing PATHWORKS?

This article has been archived and is no longer updated by Apple.
Your problem is caused by the VAX sending the LaserWriter control characters that are understood only by DEC laser printers or third-party printers with DEC emulation. On a DEC LN03, for example, in order to bold a string, you have to enclose the string with 2 control characters, one at each end. You also have to do this twice, for the top half and the bottom half of the string. When not interpreted, this prints out as two lines, sometimes with extra characters at the beginning or at the end of the string.

PATHWORKS uses a print symbiont called VAXshare symbiont to convert VMS text into PostScript data before sending it to the LaserWriters. Another symbiont, called the PostScript printer symbiont, transfers data to a Digital PostScript printer.

You'll need to send VMS text to the VMS queue system, and need a similar "symbiont" to do the translation to PostScript. Unfortunately, no vendor is selling just the VAX queue symbiont alone. They all come as part of the package. You might want to contact Pacer and Alisa to see if they sell the VAX print service separately.

MicroPhone won't solve this problem for you. And you can't use PATHWORKS' VAXshare print service without purchasing PATHWORKS for Digital.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

Personal LaserWriter: No Refurbishment Kit

Why doesn't Apple offer a refurbishment kit for the Personal LaserWriter printers?

This article has been archived and is no longer updated by Apple.
The Personal LaserWriter engine life is rated at a minimum of 150,000 pages. The pick-up roller and separation pad each have a minimum rated life of 50,000 pages. However, since most users use the cassette tray, these parts will most likely last well beyond their 50,000-page rating. Also, the fuser assembly, laser scanner assembly, and other moving parts are expected to last the life of the engine. Therefore, there is no need for a refurbishment kit.

The LaserWriter and LaserWriter II engines have engine-life ratings that exceed the working life of several of their major modules (such as the fuser, cassette pick-up assembly, and transfer guide assembly). Therefore, refurbishment programs were created to ensure that proper maintenance is performed at the proper intervals.

Lisa 1/2-MB System: Error 815/315 while installing OS 3.0

This article has been archived and is no longer updated by Apple.
Error 815/315 indicates your system is out of memory. This error appears when you initialize your hard disk before installing Lisa Office System Release 3.0 software on a 1/2 meg system. You will need to obtain a 512K Add-On Memory Board before you can successfully install the software; alternatively, you could obtain Lisa Office System Release 3.1, which allows you to install the Office System using 1/2 megabyte.

LaserWriter IIf and IIg: Function of Jumper J11

On the Apple LaserWriter IIf and IIg I/O controller board, near the ROM chips, is a set of jumper pins labeled J11. What is their function?

This article has been archived and is no longer updated by Apple.
The jumper pins labeled J11 are at board position L7. The jumper pins allow the use of 8-megabit ROM chips, providing a total of 4MB of ROM space.

The jumper is factory set at the 2MB setting to allow the use of four 4-megabit ROMs, providing a total of 2MB of ROM space. There are no existing Apple or third-party upgrades that use the 4MB setting.

All Apple LaserWriter IIf and IIg printers should be set at the 2MB setting.

StyleWriter Sheetfeeder: Paper Pickup Ratcheting Noise Is Normal

My StyleWriter sheetfeeder makes a ratcheting noise during the paper pickup process. Is this noise normal?

This article has been archived and is no longer updated by Apple.
The StyleWriter printer sheetfeeder does make a racheting noise during the paper pickup process. This noise is normal and is no cause for concern.

The sheetfeeder mechanism is powered by a single drive gear, which mates to the StyleWriter printer. The sheetfeeder contains no sensors or other feedback devices for the StyleWriter to gather paper status information. The paper pickup sequence consists of a carefully orchestrated set of forward and reverse paper-feed motor movements. These movements allow the paper pickup rollers to pick up a single sheet of paper and return to their home position. The ratcheting sound is created by an integral one-way clutch mechanism inside the sheetfeeder.

ImageWriter LQ:Testing Sheetfeeder/Tractor-Feed Paper-Out Sensor

The ImageWriter LQ has two paper-out sensors; however, the Technical Procedures Manual has information for testing only the least-used bottom-feed sensor.

How can I test the other paper-out sensor used for the sheetfeeder and tractor-feed paper?

This article has been archived and is no longer updated by Apple.
To test the paper-out sensor used for everything except bottom-feed paper, follow these steps:

1) Using standard procedures, remove the printer top cover.

2) Power on the printer without any paper inserted.

3) Configure a multimeter to measure between 0-5 volts DC.

4) Locate connector C9 on the logic board.

5) Connect the GND lead to pin 5 and the positive lead to pin 3. Without any paper inserted in the printer, the measured voltage should be approximately 4-5 volts.

6) Insert a piece of paper in the printer and monitor the multimeter. As paper is inserted, the voltage should drop from 4-5 volts to almost zero volts. Repeat this process several times to ensure proper operation of the sensor.

If this change does not occur, the paper-out sensor is probably defective and should be replaced.

PowerBook Fax Sender: Configure Receiving Fax to Print Header

The Fax/Data Modem for the PowerBooks doesn't allow the receive modem to date stamp the top of the page as other fax machines do when they send faxes. After testing it here I've come to the conclusion that this has to be something in the software and not the fax itself that is dropping this date stamp from the top of the page.

This article has been archived and is no longer updated by Apple.
Depending upon how a fax machine is configured:

- It can generate a header, which may include the date and time as a part of the fax image it sends, or

- Automatically print a header on the fax image it receives.

The PowerBook Fax Sender software doesn't include a header in the fax it generates. It does however send its Station ID. It's the responsibility of the receiving fax machine to shape and include it in the fax image it prints. The receiving fax machine needs to be configured to do this.

So, if you have your fax machine configured to generate headers on sent faxes but not on received ones, this would explain why you aren't seeing headers printed on faxes received from PowerBooks.

AppleColor High-Res RGB Monitor: Voltage Range Label Error

Later model 13-inch AppleColor High-Res RGB Monitors no longer designate on the back panel that they are compatible with voltages from 100 to 240. They show only 110-120 volts. Have there been any engineering changes to this monitor?

If the monitor is being driven from the power output on the back of a Macintosh, will the correct voltage be delivered to the monitor even when the Macintosh is plugged into a European power source?

This article has been archived and is no longer updated by Apple.
The current specification sheet states that the AppleColor Hi-Res RGB Monitor (model number M1297) supports a voltage range from 85 to 270 VAC, and a power frequency range of 47 to 63 Hz.

There were some internal design changes in the revision B monitor, but the voltage and frequency range remained the same. Most of the changes were made to meet the Swedish guidelines for ELF emissions.

The back panel identification was an oversight when the labels were printed, and the voltage range information was left off the label. Our engineers are aware of the problem and this should be rectified in future shipments of the monitor.

In regard to the power out of the back of a Macintosh II, the power supply switches the power from the wall to the output plug. No voltage processing takes place. Any device that has the power plugged into the back of a Macintosh must meet the power requirements of that country.

A/UX: Remote Dump to Magnetic Tape Drive

I'm trying to do a remote dump (rdump) from a Macintosh IIfx on an Ethernet network to a 1/4-inch cassette tape drive on a Concurrent computer on the same network. The device file for the tape drive is /dev/rctp. The address on the network and in the /etc/NETHOSTS is mdsaero. I think everything is set up properly now since the dump process begins. The following is the command I issued:

```
macunix.root 1 # rdump 0usf 28800 mdsaero:/dev/rctp /dev/dsk/c5d0s3
DUMP: Date of this level 0 dump: Mon Feb 24 15:33:14 1992
DUMP: Date of last level 0 dump: the epoch
DUMP: Dumping /dev/rdsk/c5d0s3 (/users) to /dev/rctp on host mdsaero
DUMP: mapping (Pass I) [regular files]
DUMP: mapping (Pass II) [directories]
DUMP: estimated 201945 blocks on 0.41 tape(s).
DUMP: Protocol to remote tape server botched (code /etc/rmt: Command not
found.
?).
rdump: Lost connection to remote host.
DUMP: Bad return code from dump: 1
macunix.root 2 #
```

Note: slice 3 is a 400MB (approximately) partition and the tape cassette is a 525MB tape. The procedure also won't work with a 120MB tape.

This article has been archived and is no longer updated by Apple.

According to the above error message, "... remote tape server botched (code /etc/rmt: Command not found," the problem is apparently on the remote host.

The /etc/rmt can't be found in the mdsaero host. The /etc/rmt is a remote magtape protocol program used by the remote dump (rdump) and remote restore (rrestore) programs in manipulating a magnetic tape drive through an IPC (Inter Process Communication) connection. The /etc/rmt is normally started up with an rexec() and rcmd() call.

Check the mdsaero host to see if it supports the remote procedure call for a remote magnetic tape drive. A/UX and most BSD UNIX systems support this facility.

MacX: snftobdf Utility Converts SNF Fonts to BDF (9/94)

On the Tech Info Library, an article mentions a public domain software utility called 'snftobdf' converter for X-Window fonts. Is this a UNIX- based product that compiles on the X client or at the MacX end?

We need to send Adobe, BDF, and SNF fonts to MacX from a Motorola X- Window/Motif client that's running Word Perfect and FrameMaker for UNIX.

This article has been archived and is no longer updated by Apple.
Yes, the "snftobdf" is a public software utility for converting SNF (Server Normal Format) fonts into the BDF (Bitmap Distribution Format) fonts. It's UNIX-based, and runs at the X client end. Basically, you may convert SNF fonts on a UNIX-based X11 client host, and transfer them to a Macintosh OS computer. Then under MacX, you can use the Font Director facility to compile the BDF fonts into the X fonts that the MacX server can use.

For more detailed information on how to compile BDF files within MacX, see page 101 of Apple MacX User's Guide, "Compiling fonts from BDF files."

You can find a copy of snftobdf on AppleLink.

AppleColor Monitor 100: Power Supply Board Fuse And Logic Board

This article has been archived and is no longer updated by Apple.

--> If you receive an AppleColor Monitor 100 that has no power or no raster, a blown fuse, F601, on the Power Supply board may have caused the failure. This easily detected problem may be corrected by installing the 250V, 2A, slow-blow fuse which has been added to the AppleColor Monitor Service Price List under Replacement Parts (Service Programs Manual, Page 7.10.3). This fuse, part number 740-0204, is available immediately. Refer to the March Technical Procedures update for instructions for replacing the fuse.

--> In March 1985, Apple sent out AppleColor 100 Monitors with Rev. O of the service stock logic board. Later that month, though, the logic board was revised, and subsequent monitors were sent out with this new logic board--Rev. A. Rev. O and Rev. A logic boards are NOT interchangable: a Rev. O logic board cannot be used to repair a Rev. A system, and vice versa. Dealers should therefore purchase Rev. A logic boards in order to be able to support the new monitors. Instructions for recognizing and replacing boards have been included in the AppleColor Monitor March 1985 Technical Procedures. The Rev. A logic board has been added to the AppleColor Monitor Service Price List under Service Stock and Exchange Modules.

NOTE: You will be reimbursed for repairs involving both fuses and logic boards in systems covered under warrranty or AppleCare.

DOS PC-to-LaserWriter IIf,IIg: Troubleshootg Print Problem(3/94)

We have a Macintosh LC and an AST Premium II (386-PC compatible) connected to an Apple LaserWriter IIf. We have no problem printing from the Macintosh to the LaserWriter, but we can't print from the AST to the LaserWriter.

We added these mode statements to the autoexec.bat:

mode com1:9600,n,8,1
mode lpt1:=com1:

which redirects the print command to com1.

When we tried to print screen, nothing happened. When we tested with CheckIt (PC diagnostics), we got a print error.

We tried to print from WordPerfect 5.1 using HP emulation, and it won't print. We set the printer select switch to 1 and ran the self-test, which showed RS-232C, 9600, Raw Input. We had a cable made to the specifications in the Tech Info Library article titled "LaserWriter IINT to IBM PC: Pinouts for DB-25 Connection. We tried it both with HW handshaking (DTR) and SW handshaking (XON/XOFF) -- WordPerfect 5.1 has a setup for XON/XOFF, and we set it to on.

Can you help us troubleshoot the problem?

This article has been archived and is no longer updated by Apple.
Are you sending PostScript or HP emulation? For both the Macintosh and the PC to be connected at the same time, both have to send PostScript to the printer. The printer cannot switch between HP emulation and PostScript on the fly.

This configuration requires the printer select switch to be set to either 0 or 5.

Here's a test you can run to determine if this is a hardware or software problem:

1) Turn off the printer and set the select switch to 1 (HP LaserJet Emulation).

2) Ensure that you are using a Null Modem Cable.

3) Issue the appropriate Mode Commands:

Mode Com1: 96,8,1,n,p

Mode LPT1: = Com1:

4) Issue a CTRL-P. This redirects the screen output to the list device.

5) Perform a few DIR commands. You should see the light on the LaserWriter blink.

6) Issue a CTRL-L. This sends a form feed to the printer and ejects the page.

7) Issue a CTRL-P. This redirects the output back to the screen.

If the keyboard hangs or the light doesn't blink during this procedure, you have a hardware problem. The likely causes are the cable, the serial port on the IBM, or the logic board on the printer.

If you get output, the problem is most likely in software. Check the configurations of the applications you are using on the PC side.

Note that this only tests the hardware configuration. You should set the printer back to PostScript, so that the Macintosh can print to it.

RAM: Faster-than-Required SIMMs Don‘t Improve Performance

Will performance on my Macintosh Quadra 700 increase if I use SIMMs rated at 60 ns instead of the recommended 80 ns?

This article has been archived and is no longer updated by Apple.
Performance will not increase if you install SIMMs rated at 60 ns in a Macintosh Quadra because the SIMMs still will be accessed at the 80-ns rate.

A problem with incorrect SIMM speeds is encountered when the SIMMs are too slow for the system in which they are installed. For example, if you put 120-ns SIMMs in a system that requires 80-ns SIMMs, the CPU accesses the 120-ns SIMMs at the faster 80-ns rate. This causes those slower SIMMs to overheat, produce random errors, and eventually fail completely.

Personal LaserWriter NTR: Communication Arbitration

The Personal LaserWriter NTR has three communication ports that can be active simultaneously. Special arbitration logic controls the activity among the three ports.

This article has been archived and is no longer updated by Apple.

Because PostScript processes one job at a time, only one port can have access to the printer at any given time. Arbitration logic polls the ports in a round-robin fashion until it senses activity in one of the three ports. It terminates polling at connection and the beginning of job execution. A connection, in this sense, refers to the dedication of the printer to a communication port while receiving PostScript jobs from a host. AppleTalk ports may process multiple jobs during a single connection while the other serial port connections have only one job. Receiving an EOF (end-of-file indicated end-of-job) character terminates a non-AppleTalk connection.

The port arbitration cycle begins whenever a host terminates a connection. It determines polling order by always polling the port that has gone unpolled for the longest time. This procedure ensures that one port won't dominate the printer. If an active PostScript job opens a port directly, that port is excluded from arbitration until the job closes it again. A PostScript job opening a serially connected sheet feeder is an example of this type of port activity.

All three ports respond to status request, with current printer status, unless excluded from the port arbitration cycle as previously explained, or just configured inactive. Directly opened ports may either respond with stale status or not respond at all. Ports not arbitrated due to configuration may not respond or even appear on the network.

TA48262_Personal_LaserWriter_NTR_Utility_Software__(TIL09938).pdf

Personal LaserWriter NTR: Utility Software 7.2

This article describes the Utility software, version 7.2, used with the Personal LaserWriter NTR.

This article has been archived and is no longer updated by Apple.
The LaserWriter Utility software provided with the Personal LaserWriter NTR is a slightly revised version of the utility that shipped with the LaserWriter IIf and IIg. The updated version includes some bug fixes and some minor changes to handle port configuration. These are the supported functions:

- Disable Start
You can disable/enable the printing of the page Start Page when you turn the printer on.

- Configuration
You can set the parameters for user-defined switch settings (emulation, baud rate, data length, hand shaking, port, and cut sheet feeder).

- Naming
You can change the printer's name.

- Download Fonts
You can download PostScript and TrueType fonts to DRAM.

Macintosh LC II: Connecting a VGA Monitor

What are the pinouts for connecting a VGA monitor to the Macintosh LC II computer?

This article has been archived and is no longer updated by Apple.
To recognize a VGA monitor, you must wire pins 10 and 7 together. Since Macintosh LC II always grounds ID bit 2, this wire will cause ID3 to be grounded and will make the VGA ID appear.

Macintosh LC VGA Connector
DB-15

2 ---------- Red Video ---------- 1
1 ---------- Red Ground ---------- 6
9 ---------- Blue Video ---------- 3
13 ---------- Blue Ground ---------- 8
5 ---------- Green Video ---------- 2
6 ---------- Green Ground ---------- 7
15 ---------- Hsync ---------- 13
12 ---------- Vsync ---------- 14
14 ---------- Sync Ground ---------- 10
10 ----------|
7 ----------| Connect 7 and 10 so the sense pin ID will equal VGA

A few issues to keep in mind:

- VGA monitors may vary, depending on the vendor. Check with the vendor about Macintosh LC II compatibility before buying.

- Vendors have different image quality specifications. There may be significant differences between Apple monitors and VGA monitors. Do a side-by-side comparison of a VGA monitor with an Apple monitor before buying.

- When a VGA monitor is connected as described in the pinout above, the resolution is 640 x 480. The bit-depth supported depends on the amount of VRAM installed. For example, if a 256K VRAM SIMM is installed, 4-bit color (16 colors) is supported. If the 512K VRAM SIMM is installed, 8-bit (256 colors) is supported.

Published Date: Feb 18, 2012

Macintosh LC II: RAM Configuration and 10 MB Limit (7/96)

Is there a technical reason for the 10 MB limit on RAM for the Macintosh

LC II and Performa 400, 405, and 430 computers?

This article has been archived and is no longer updated by Apple.

The Macintosh LC II and Performa 400, 405, and 430 computers have 4 MB of DRAM soldered onto the logic board. In addition, there are two 30-pin SIMM slots that accept 1, 2, and 4 MB SIMMs, which results in 4, 6, 8, and 10 MB configurations. SIMMs should be fast-paged mode, 100 nanoseconds (ns) RAM access time, or faster.

Although you would physically have 12 MB of DRAM installed in the computer if you populated each SIMM slot with 4 MB SIMMs, the total amount of addressable RAM is limited to 10 MB. As a result, when you populate your board with two 4 MB SIMMs, the lower 2 MB of DRAM on the logic board cannot be accessed.

This 10 MB addressable RAM limit on these computers is because the hardware only uses 24 address lines to select addresses, regardless whether it is in 24- or 32-bit mode. This means the hardware can access only $xx00 0000 - $xxFF FFFF, or 16 MB of address space. The hardware ignores the upper 8 bits of the address.

A distinction must be made between what the hardware looks at and what the software looks at. In 32-bit mode the software looks at all 32 bits of the address, but when the software tries to read a value from the memory location $40A0 0000, for example, the hardware, ignoring the upper 8 bits of this address, reads a value from $00A0 0000 instead.

In addition, since the ROM is mapped by the hardware to $00A0 0000 in both 24- and 32-bit modes and RAM needs to be contiguous, the largest contiguous amount of memory is from 0 -$9F FFFF, which is 10MB.

TA48265_Macintosh_LC_II_Software_Compatibility_(TIL09943).pdf

Macintosh LC II: Software Compatibility

Are there any software compatibility problems with the Macintosh LC II?

This article has been archived and is no longer updated by Apple.
Software compatibility test results show no new software compatibility problems.

Some cards need latest drivers:

- The LC Ethernet card requires a ROM revision (Service upgrade).

- The Apple IIe card requires 2.1 driver (on networks, and so on).

An expansion card compatibility list ships in the Macintosh LC II box. This list indicates the versions required to run properly on the Macintosh LC II. Since we found no new software compatibility problems, no software compatibility list will be included.

Published Date: Feb 18, 2012

Macintosh LC II: LC Ethernet Card Requires New Driver

I heard that the Macintosh LC Ethernet card works in the Macintosh LC II, but requires a driver upgrade.

This article has been archived and is no longer updated by Apple.
For use in the Macintosh LC II, the Ethernet card requires a ROM upgrade that contains a new driver.

Published Date: Feb 18, 2012

Macintosh LC II: Doesn‘t Support 65.5K Colors

Why doesn't the Macintosh LC II support 2^16 (= 65.5K, or 65,536) colors?

This article has been archived and is no longer updated by Apple.
All video timing modes use a 256 x 24 Color Look-Up Table (CLUT). Monochrome mode also uses the CLUT, driving the R, G, and B with the same signal. When you select the thousands of colors mode in the monitor CDEV, you are selecting 16 bit/pixel format. The 16 bit/pixel assigns the uppermost bit to an Alpha Channel and 5 bits each for Red, Green, and Blue.

Selecting thousands mode divides the 256 x 24 CLUT into three 32 x 8 tables, allowing display of 32 levels of each color from a selection of 256. The 555 data is applied to each of these tables, resulting in 888 output values. The CLUT is used so that gamma correction can be applied, even in the direct color mode. Therefore, you will get 2^16-1 = 32^3 = 32.7K color selections from a palette of 2^24 = 16.7 million color choices.

Macintosh LC II: Video (7/93)

Article Change History

07/12/93 - REVISED
* To include Performa

This article describes the video capabilities and expansions available for the Macintosh LC II, and Performa 400, 405 and 430.

This article has been archived and is no longer updated by Apple.
Macintosh LC II comes with either a 256K or 512K VRAM SIMM. The VRAM is installed in a 32-pin SIMM slot. There are three possible SIMMs you can use:

* NO VRAM (a SIMM containing two transparent latches)
- monochrome on Macintosh 12-inch Monochrome Display
- monochrome on 13-inch AppleColor High-Resolution RGB Monitor
- monochrome on VGA
* 256K VRAM SIMM option (Performa 405)
- 16 grays on Macintosh 12-inch Monochrome or VGA
- 256 colors on Macintosh 12-inch RGB Display
- 16 colors on 13-inch AppleColor High-Resolution RGB Monitor or VGA
* 512K VRAM SIMM option (Performa 400 and 430)
- 256 greys on Macintosh 12-inch Monochrome or VGA
- 32,000 colors on Macintosh 12-inch RGB Display
- 256 colors on 13-inch AppleColor High-Resolution RGB Monitor or VGA

Timing Modes

The Macintosh LC II supports the following four video timing modes:

Resolution	Supported	Vertical	Horizontal	Bandwidth
512 x 384	Macintosh 12-inch RGB	60.15	24.48	15.67
640 x 480	Macintosh 12-inch Monochrome AppleColor 13-inch	66.62	34.98	31.33
540 x 384	Macintosh 12-inch RGB Macintosh 12-inch Monochrome AppleColor 13-inch	60.15	24.48	17.23
	VGA	59.94	31.47	25.18

All video timing modes use a 256 x 24 Color Look-Up Table (CLUT). Monochrome mode also uses the CLUT, driving the R, G, and B with the same signal. When you select "thousands of colors" in the Monitors control panel, you're selecting 16 bit/pixel format. The 16 bit/pixel assigns the uppermost bit to an Alpha Channel and 5 bits each for Red, Green, and Blue. Selecting thousands mode divides the 256 x 24 CLUT into three 32 x 5 tables. Therefore, you get 2^15 = 32^3 = 32.7K color selections.

Monitor Video Connectors

Macintosh LC II uses a DB-15 female connector to connect to the video monitor. Here's the pin-out:

Pin	Signal	Description
1	RED.GND	Red Video Ground
2	RED.VID	Red Video
3	CSYNC~	Composite Sync.
4	MON.ID1	Monitor ID, Bit 1
5	GRN.VID	Green Video
6	GRN.GND	Green Video Ground
7	MON.ID2	Monitor ID, Bit 2
8	nc	(No Connection)
9	BLU.VID	Blue Video
10	MON.ID3	Monitor ID, Bit 3
11	CSYNC.GND	CSYNC Ground
12	VSYNC~	Vertical Sync.
13	BLU.GND	Blue Ground
14	HSYNC.GND	HSYNC Ground
15	HSYNC~	Horizontal Sync.
Shell	S.GND	Chassis Ground

Three of the 15 pins (pin 10, 7, and 4) are used to send a signal to identify the monitor type. Once identified, Macintosh LC II synchronizes the correct video timing.

The monitor IDs are:

Connector pins 10,7,4	Monitor ID bits 321
Macintosh 12-inch Monochrome	110
Macintosh 12-inch RGB Display	010
Apple IIe mode	010
AppleColor 13-inch RGB	110
VGA	011
No Monitor	111

When no monitor (111) is attached, 512 x 384 video timing is selected. Macintosh LC II performs a special function of always returning a 1 to the Monitor Parameters Register when reading Monitor ID bit 2. By performing this special function, various monitors can select the correct video timing schemes. The VGA monitor (011) has the same monitor ID as the two-page monochrome. Neither the Two-Page nor the Portrait monitor can be attached to Macintosh LC II.

ON	-	-	-	-	X	-	-	X

Switch 1

Position	1	2	3	4	5	6	7	8
OFF	-	-	-	X	X	-	-	-
ON	X	X	X	-	-	X	X	X

The diagrams of these switches are presented as seen from the back of the Daisy Wheel Printer or Letter Quality Printer. The front switches are rocker switches; X means that that side of the switch is down. The rear switches are toggle switches; X marks the toggle.

The front switch settings are for 12 characters per inch (1-2), 11 inch form length (3-6), no carriage return line feed (7), and 6 lines per inch (8).

SUPER SERIAL CARD:

Switch 1

Position	1	2	3	4	5	6	7
ON	-	-	-	X	-	X	X
OFF	X	X	X	-	X	-	-

Switch 2

Position	1	2	3	4	5	6	7
ON	X	-	-	X	-	-	-
OFF	-	X	X	-	X	X	X

AppleWorks sends a carriage return code to the printer as part of the setup command. When the SSC sees this code and you have configured the SSC to add a line feed, the printed page gets one line more than AppleWorks has calculated for the page. This can lead to misprints, often called paper creep, which get worse with each successive page.

To work around this problem, set the SSC for no <lf> after <cr>: Switch 2: Position 5 -> ON
Published Date: Feb 18, 2012

Macintosh LC II: Virtual Memory

The Macintosh LC II supports a demand paged virtual memory environment -- a distinct advantage over its predecessor, the Macintosh LC. The 68030 microprocessor comes equipped with the MC68851 PMMU (page memory management unit).

This article has been archived and is no longer updated by Apple.

Addressing Scheme

The Macintosh LC II can generate either 24-bit or 32-bit virtual addresses.

The 24-bit mode allows a total of 11MB virtual memory. In 24-bit mode the total addressing space is 16MB. In this address space, 2MB is reserved for ROM, 1MB for I/O, 1MB for video, and 1MB is just reserved for a total of 5MB used in this 16MB space. The PDS slot also takes up 1MB. So when a card isn't installed, virtual memory can use this space. With a PDS card present, 10MB of virtual memory is available.

In 32-bit mode, because the ROM is 32-bit clean (that is, the ROM code has the ability to use the full 32 bits of address space), the total addressing space is 232, or 4 gigabytes. Of this 4 gigabytes, 3 gigabytes is used for ROM, I/O, slot space, and expansion, leaving a maximum of 1 gigabyte for virtual memory.

Virtual Memory

With the Macintosh LC II, limited RAM expandability and the cost of RAM SIMMs makes virtual memory an attractive option. Virtual addressing allows the Macintosh LC II to address data on a disk drive as if it were in main memory. That means that you can launch more applications and data on the Macintosh LC II than the amount of installed RAM can contain.

The 68030 and its PMMU provide the hardware support for virtual memory. PMMU performs memory paging, a technique where a needed page of memory is transferred (swapped) into main memory from the disk. In addition, the PMMU swaps out of main memory, a page that isn't currently needed. The PMMU keeps track of 64 pages in memory.

With 32-bit addressing on and enough space available to allocate on hard disk, you can create a very large virtual memory address space. However, it's best for performance reasons to limit the size of your virtual memory to twice the size of installed RAM. By limiting the size of your virtual memory, you'll help eliminate excessive paging activity known as thrashing.

Macintosh LC II: Not Capable of Running A/UX

Can the Macintosh LC II run A/UX 3.0?

This article has been archived and is no longer updated by Apple.
No, the Macintosh LC II cannot run A/UX, which puts heavier demands on hardware resources than the Macintosh operating system does.

The Macintosh LC II is not a suitable A/UX platform for the following reasons:

- The Macintosh LC II lacks an FPU.

- It has limited RAM expansion and internal hard disk space.

- It has a 16-bit data path.

Published Date: Feb 18, 2012

Macintosh LC II: How It Differs from Macintosh LC

This article lists the ways the Macintosh LC II differs from the Macintosh LC.

This article has been archived and is no longer updated by Apple.

- Processor: 68030 (instead of 68020)
- 4MB RAM minimum soldered onto the logic board.
- No second floppy-disk drive
- Improved VGA support (multisync).
- ASIC changes
- 030 support (related to data cache use)
- 4MB RAM on board support
- ROM space reduced to 2MB (from 4MB); allows 2MB for cards
- LOR (low-res special effect/pixel doubler)
- Removed speaker/fan plastic assembly.
- Removed second floppy connector.
- Reduced voltage sensitivity for VGA conformance.

Published Date: Feb 18, 2012

Macintosh LC II: No NTSC Video Out

Why doesn't the Macintosh LC II have NTSC video out?

This article has been archived and is no longer updated by Apple.
NTSC video, unlike standard composite, is based on half-lines, not full lines of video. Standard Macintosh video starts at the top LEFT of the screen. The Macintosh then increments down the screen one line at a time, ending the scan at the bottom right. The NTSC scan starts at the top and MIDDLE of the screen, counts down every other line, and then ends only halfway across the screen on the bottom, again in the MIDDLE of the screen.

Now, the problem is that the current Macintosh LC and LC II video architecture is based on routines with the basic unit as one full line across. In order to do NTSC, the Macintosh LC II video architecture would have to understand half-lines.

The Macintosh Display Card 4*8 and 8*24 use a completely programmable timing logic, which can do NTSC timing quite easily. However, to implement this logic on the Macintosh LC II logic board would require 3 to 5 thousand more gates on video ASIC, which are just not available in the current package. Additional video circuitry would be required.

Macintosh LC II: No Support for 16" or 21" Monitors (2/93)

Article Change History

02/26/93 - UPDATED
* To include information on products that provide larger monitor support.

Can the Macintosh LC II support the Apple Macintosh Portrait Display, Macintosh 16" Color Display, Apple 21-inch Two-Page Monochrome Monitor, or the Macintosh 21" Color Display?

This article has been archived and is no longer updated by Apple.
The Apple Macintosh Portrait Display, Macintosh 16" Color Display, Apple 21-inch Two-Page Monochrome Monitor, and the Macintosh 21" Color Display are not directly supported on the Macintosh LC II.

Like the Macintosh LC, Macintosh LC II supports four different resolutions:
- 512 x 384
- 640 x 480
- 560 x 384 (Apple II resolution)
- VGA

The Apple Macintosh Portrait Display resolution is 870 x 640.
The Macintosh 16" Color Display resolution is 832 x 624.
The resolution on the 21-inch displays is 1152 x 870.

The Macintosh LC II on-board video is the same as the LC. The Macintosh LC II supports 256 colors on the 12-inch, and 16 colors on the 13-inch monitor.

There are third-party products that can provide the Macintosh LC and LC II with the capability of driving the larger monitors. Two such companies are Lapis and Aura Systems. You can find more information on these companies by searching on their names in the Technical Information Library and in the Redgate Products Library.

Published Date: Feb 18, 2012

Macintosh LC II: Why No Two-Floppy Configuration

Why is a two floppy drive configuration not offered on Macintosh LC II?

This article has been archived and is no longer updated by Apple.
The second floppy drive was removed to save cost and space on the logic board. In addition, the two-floppy configuration is an undesirable System 7 platform.

Published Date: Feb 18, 2012

TA48278_Macintosh_LC_II_RAM_Expansion__(TIL09957).pdf

Macintosh LC II: RAM Expansion (7/93)

Article Change History

07/12/93 - REVISED
* To include Performa

When 4MB RAM resides on the logic board, how do I populate the two SIMM slots to get 10MB in the Macintosh LC II or Performa 400, 405, and 430?

This article has been archived and is no longer updated by Apple.
In the case of 4MB soldered on the printed circuit board (PCB), you need an 8MB RAM expansion kit to get 10MB. This configuration has 12MB of RAM present in the system. However, the Memory Map reserves only the first 10MB of address space for RAM. Therefore, the lower 2MB on the PCB can't be accessed when a 4MB base system is fully expanded. Even though, 32-bit addressing allows up to 1GB address space for RAM, there are only 24 address lines. Hence Macintosh LC II can see only 10MB of physical RAM.

Macintosh Pascal 1.0: creating and accessing data files

This article has been archived and is no longer updated by Apple.
Open data files with the Reset, Rewrite and Open commands listed on pages 9-3 thru 9-5 of the Pascal Reference Manual. When accessing your data file, be sure to use a proper name. The correct format for "title" is "VolumeName: FileName", where VolumeName is the name of the diskette on which your file resides and FileName is the name of the file (see page 9-25).

If you do not know the name of the volume or file, use the OldFileName function to search for the file; alternatively, create a new file with NewFileName. OldFileName allows you to choose from a dialog box the existing files on any number of diskettes. The returned string value from these routines can then be used in a Reset, Rewrite, or Open command. Refer to page 9-26 for additional descriptions of these functions.

A possible area of confusion is with the variable-reference parameter in the Reset, Rewrite and Open commands, "f". This variable-reference is a reference to the file being accessed--for example, the command Open(TheFile, "Volume1:Inventory") opens the file "Inventory" on the diskette named "Volume1" and sets the variable-reference "TheFile" so that it refers to that particular file. Commands such as Get(TheFile), Put(TheFile) and Close (TheFile), all access this file.

OneScanner for Windows: Using Its SCSI Card with Other Devices

The SCSI card bundled with Apple OneScanner for Windows can be used with other SCSI devices, such as a hard drive. Note: Apple does not support other SCSI configurations, cards, or devices.

To use the card with a SCSI device other than OneScanner, you need the driver software that is available from Adaptec, the card's manufacturer.

This article has been archived and is no longer updated by Apple.
Using the SCSI card for other devices can be tricky. Sometimes SCSI IDs must be set with a jumper on the card and the software must be reconfigured to use another address for the card.

Similarly, the scanner will theoretically operate with other SCSI cards or some built-in SCSI implementations, but different drivers will be required -- and Apple will not support other SCSI cards. (Note that this rules out all Microchannel-equipped IBM PS/2s as supported configurations.)

Published Date: Feb 18, 2012

OneScanner for Windows: Hardware Compatibility

Apple OneScanner for Windows has been confirmed compatible with many IBM PC models and with PC-compatible systems from other manufacturers.

This article has been archived and is no longer updated by Apple.

Compatible

It would be impossible to test OneScanner for Windows with every brand of Windows-compatible hardware. It should work on most of them. These are the ones we've tested to date:

- ALR PowerFlex 386sx
- ALR486
- AST 486
- Compaq 386/33
- Compaq 486 EISA
- Dell System 325
- Gateway 386/25
- HP Vectra 386/25c
- IBM PS/2 Model 40
- NEC PowerMate 386/25s

Not Compatible

OneScanner for Windows is incompatible with the built-in SCSI implementation found on the IBM PS/2 model 95.

OneScanner for Windows is incompatible with all current Northgate PCs.

Published Date: Feb 18, 2012

OneScanner for Windows: Performance Tip

Apple Support has found that some modifications to the default CONFIG.SYS file can significantly improve the performance of OneScanner for Windows on some machines.

This article has been archived and is no longer updated by Apple.

The default settings for FILES and BUFFERS are too low for optimum performance with Ofoto.

Here is a sample file:

```
FILES=40
BUFFERS=30
DEVICE=C:\\DOS\\HIMEM.SYS
DEVICE=C:\\DOS\\SETVER.EXE
rem DEVICE=C:\\DOS\\EMM386.EXE 6496
DEVICE=C:\\DOS\\SMARTDRV.SYS 4096 1024
DOS=HIGH

DEVICE=C:\\OFOTO\\ASPI2DOS.SYS /Z /U-

TA48283_Apple_IIGS_System_Software_and_HyperCard_IIGS__(TIL09966).pdf

Apple IIGS: System 6.0 Software and HyperCard IIGS 1.1

This article describes Apple IIGS System 6.0 software and an upgraded version of HyperCard IIGS.

This article has been archived and is no longer updated by Apple.
Apple IIGS System 6 software offers an enhanced user interface, greater speed and performance, and data exchange capabilities not available on previous Apple IIGS operating systems. HyperCard IIGS version 1.1 has been upgraded to include a Media Control stack for operating CD ROMs and videodisc players, and new HyperTalk scripting capabilities. As with original HyperCard IIGS, version 1.1 is also in color.

Apple IIGS System 6 provides similar ease-of-use and functionality now available with the System 7 Finder for the Macintosh.

Features and Benefits of Apple IIGS System 6

- Three New File System Translators
These provide easy access to Macintosh disks, Pascal disks, and Apple II DOS 3.3 disks

- Control Panel and Desk Accessory Enhancements
You can open control panels directly from the desktop. The software incorporates Find File and Calculator desk accessories.

- Finder Help
You can access Finder Help through pop-up menus and keep it on screen while stepping through procedures.

- Enhanced Window Handling and Window Appearance
It's easier to move between and manage multiple windows on a single screen.

- Two New Applications: Teach and Archiver
Teach is a desktop text processor that enables you to jot down notes, read disk files, and create formatted or unformatted text documents. Teach also provides file import capability from ASCII, AppleWorks version 3.0, AppleWorks GS, MacWrite version 5.0 formats, and AppleWriter. Archiver offers flexible hard disk backup functions to save and restore either individual files or entire volumes.

- Media Control Toolset
This is a new tool/driver/control panel/desk accessory combination that allows you to integrate, configure, and manage highly sophisticated multimedia effects. Use it in conjunction with HyperCard IIGS version 1.1 to optimize the toolset's performance.

- The Universal Access Suite
This suite (also available on Macintosh System 7 software) opens the Apple IIGS to disabled users via Video Keyboard, Easy Access, and Closeview programs.

- As with the System 5 series, Apple IIGS System 6 users can network their Apple IIGS computers with each other and with Apple IIe, Macintosh, and MS-DOS computers. However, System 6 improves networking functionality via EasyMount, a new feature that allows users to mount a network server with a simple double-click command.

- Apple IIGS System 6 replaces Apple IIGS System 5.0.4 for the stand-alone Apple IIGS, providing a consistent graphical interface and high performance for both the individual and networked user.

Speed and Feature Enhancements for HyperCard IIGS 1.1

- Media Control Stack
This allows control of external media devices such as laserdisc players and CD-ROM drives from within the stack. A common interface to two external devices provides control, using standard buttons or floating control panels for "Play," "Fast Fwd," and so on.

- Tune Builder Stack
This allows you to create short original tunes by simply clicking the mouse on the stack's music staff. You can play notes in variable time, and with the voices of a large collection of instruments. You can use these tunes as enhancements to other original stacks by cutting and pasting.

- Features from Macintosh HyperCard Versions 2.0 and 2.1
- HyperTalk extensions
- X Windows

- The Apple IIGS SuperDrive Controller Card
Available for the enhanced Apple IIe and Apple IIGS, this allows users to use Apple's SuperDrive, which permits the use of 1.4MB floppy disks. The SuperDrive card also operates all other Apple II 3.5 disk drives.

System Requirements

- Apple IIGS personal computer with at least 1MB of RAM, ROM version 01 or 03 and one 3.5-inch disk drive, although configurations of 2MB of RAM and a hard drive is recommended for optimal performance.

- Networked systems require Apple IIGS computers with at least 768K RAM, ROM version 01 or 03, and appropriate LocalTalk cables.

- HyperCard IIGS version 1.1 requires an Apple IIGS personal computer with 1.5MB RAM, one 800K disk drive and hard disk or connection to a networked environment, and system software 5.0.3 or subsequent version.

Macintosh Pascal: Printing

This article has been archived and is no longer updated by Apple.
To print from your Pascal program, open the printer with the command Rewrite (f,"printer:"). The commands Write(ThePrinter,p1[p2,...,pn]) and WriteLn (ThePrinter,p1[p2,...,pn]) cause the values represented by p1, p2, etc., to be sent to the printer (See pages 9-16 thru 9-20 of the Macintosh Pascal Reference Manual.). Since Pascal considers every peripheral device to be an external file, a program never directly accesses a driver.

From within a program, printing sends data to the printer via the serial port selected in the Chooser. A Laserwriter in the Diablo 630 mode (NOT over AppleTalk) can print the text as can any printer that functions serially on the Macintosh. Simply send the appropriate ASCII "escape" sequences for the specific printer and then send the ASCII text.

To print the width of the 15" ImageWriter, the user should determine how many characters are sent before sending a CR/LF, which in turn determines the length of the line.

A good example would be the "PRINTTEXTFILE" sample included on the Pascal disk, which includes a technique for setting up the printer so that it skips page breaks.

TA48285_Personal_LaserWriter_LS_Software_Upgrade_(TIL09970).pdf

Personal LaserWriter LS: Software Upgrade

This article describes a software upgrade for the Personal LaserWriter LS.

This article has been archived and is no longer updated by Apple.
The software upgrade for the Personal LaserWriter LS includes seven new font families and improved installation software. The new fonts are: ITC Avant Garde, ITC Bookman, New Century Schoolbook, Helvetica Narrow, Palatino, ITC Zapf Chancery, and ITC Zapf Dingbats. The new font set is fully compatible with System 7, and with virtually all software applications.

Apple has also improved the installation of fonts, driver, and printer software with a new installer. This new installer enables users to install or remove fonts, and add new printer software by clicking a button.

MacTCP 1.1: Communicating with SGI Indigo UNIX Computer

I'm having problems communicating with an SGI Indigo UNIX computer using a Macintosh with MacTCP 1.1

Here's the scenario:

I'm connected to an Ethernet network with two Indigo boxes. We've isolated this segment; only our three computers are on it.

- Indigo #1 - 192.100.2.2
- Indigo #2 - 192.100.2.4
- Mac IIfx - 192.100.2.43 (MacTCP, version 1.1)

The Indigos "ping" each other successfully.

I boot a computer with system 7.0.1, but I don't respond to an Indigo's attempt to "ping" me.

I use Etherpeek on the same Macintosh IIfx, and I see their "ping" request packets on the network (even the one addressed to me). Etherpeek gets information, and confirms that I have configured the proper MacTCP address.

I open MacTCP SPY, and I suddenly begin to respond to the "pings." I can then use VersaTerm Pro with the Telnet Comm Tool drivers to log on to the Indigo with no problems. By the way, I continue to respond to the "ping," even when I close MacTCP SPY.

Rebooting with System 6.0.7 on the hard drive, I still don't respond to a "ping," even when I use MacTCP SPY to "kick start."

In short, I need to enable the 6.0.7 Macintosh IIfx to communicate, preferably without a MacTCP Spy "kick start." If the solution is to upgrade to System 7, then I need to have this same capability on this platform as well.

This article has been archived and is no longer updated by Apple.
The actions you describe are exactly the way MacTCP was designed to operate. The driver isn't loaded until the first TCP/IP application is launched. This is true for both 6.0.7 and 7.0, or we should say MacTCP 1.0 and 1.1.

You shouldn't have to kick-start MacTCP unless you want it to respond to ICMP messages before you run a MacTCP application. If this is the functionality you desire, just set MacTCP Spy as a startup application. This will work under both System 6.x and System 7.x.

AppleTalk: DDP Encapsulated in IP (IP Tunneling)

Is there any way to encapsulate an AppleTalk packet (DDP) into an IP packet to send over an IP protocol only network?
This article has been archived and is no longer updated by Apple.
What you describe is known as IP tunneling, where a gateway/router connected to both an AppleTalk network and an IP network wraps a DDP packet inside a UDP packet. It then transmits that packet across the IP network to another gateway/router that is capable of de-encapsulating the packet.

The IP Extension to the Apple Internet Rounter (AIR) does just that. When talking to another AIR running the IP Extension, you can tunnel AppleTalk through an IP network, including the Internet.

AMP Thinnet and FriendlyNet

I have AMP's Thinnet tap system for Thinwire Ethernet. AMP uses a special vampire-style plug in the wall and a cable running to the user's workstation that plugs into the coax port on the interface card.

We had a problem with FriendlyNet. Since we have two ends, we either get too many terminations on the network (two existing plus one automatic from the transceiver), or reflections (if we open one end up by using a barrel connector). Neither case led to a healthy network.

This article has been archived and is no longer updated by Apple.

```
You need to use a 222814-1 Test Cable Assembly.  This device provides two
coax cables that plug into either side of the FriendlyNet transceiver.  AMP
is 802.3 compliant (the run from the faceplate to the user contains both
"ends" of the network).
```

AppleTalk Phase 2: OUI in Ethernet to FDDI Bridges

I have a question about the bridging problem with AppleTalk Phase 2 and FDDI. I found some information that says the IEEE 802.1 committee is currently formalizing the use of OUI in Ethernet to FDDI bridges that will define what to do if a bridge encounters SNAP headers with OUI=0. What is the status of this?

This article has been archived and is no longer updated by Apple.
The IEEE 802.1 committee has adopted the proposal which we, in conjunction with DEC, brought before them to resolve the conflict in using OUI 0. The 802.1 committee has moved the 802.1h specification to the "recommended practice" status which is just short of being a fully adopted and ratified standard.

The 802.1h specification defines how an Ethernet to FDDI translational bridge should operate in the presence of packets that use OUI 0. This is basically a simple filter mechanism which is implemented in the bridge that checks the packets OUI:

- If it's 0, it then checks to see if the packet type is AppleTalk.

- If it's an AppleTalk packet, then it doesn't do any translation.

The key here is to make sure that any potential FDDI bridge vendors have implemented the 802.1h specification.

TA48293_Macintosh_Pascal_Accessing_the_Toolbox_(TIL00998).pdf

Macintosh Pascal: Accessing the Toolbox

This article has been archived and is no longer updated by Apple.
Apple does not support any Toolbox routine that is not a built-in Macintosh Pascal function or procedure documented in either the Reference Manual or the Technical Appendix. We can only refer you to the Inside Macintosh documentation. A brief description of "Inline", a routine which enables you to access the Toolbox, may be found on the Macintosh Pascal diskette in the text file named "InLines". Note: careless or erroneous use of the "InLine" facility can be fatal to your diskettes or data.
Published Date: Feb 18, 2012

AAUI: Pinout Equivalents to AUI

What are the pinout equivalents of the AAUI (Apple Attachment Unit Interface) to the standard AUI (Attachment Unit Interface)?

What pin connections are needed for a cable to connect an Apple AAUI to DB15 connector (vampire clip) coming off of a thicknet cable?

What is the maximum length for this cable?
This article has been archived and is no longer updated by Apple.
Here are the pinouts for the AUI interface per 802.3 and the matching AAUI pin number:

1 - Shield (Control In shield)
-- Not mandatory and not implemented on AAUI

2 - Collision Presence (+) (Control In circuit A)
-- AAUI pin 5

3 - Transmit (+) (Data Out circuit A)
-- AAUI pin 9

4 - Reserved (Data In shield)
-- AAUI Shell

5 - Receive (+) (Data In circuit A)
-- AAUI pin 2

6 - Power Return (Voltage Common)
-- AAUI pin 4

7 - Reserved (Control Out circuit A)
-- Not mandatory and not implemented on AAUI

8 - Reserved (Control Out shield)
-- AAUI Shell

9 - Collision Presence (-) (Control In circuit B)
-- AAUI pin 6

10 - Transmit (-) (Data Out circuit B)
-- AAUI pin 10

11 - Reserved (Data Out shield)
-- AAUI Shell

12 - Receive (-) (Data In circuit B)
-- AAUI pin 3

13 - Power (Voltage Plus)
-- AAUI pin 1

14 - Reserved (Voltage shield)
-- AAUI Shell

15 - Reserved (Control Out circuit B)
-- Not mandatory and not implemented on AAUI

You can use the same specifications as apply to the AUI cable to compute the maximum length of the AAUI cable when used to interface to a 10BASE-5 network. Hence the AAUI cable could be up to 50 meters long. When attaching to other 802.3 compliant networks, the length of the AAUI cable has different characteristics. When used to attach to a 10BASE-2 network the AAUI cable length should be limited to 1.33 meters.

The biggest problem you're going to face in putting this type of cable together is that all Macintosh computers don't have +12 volts available to drive the AUI transceiver. The transceiver needs an external power supply.

10BASE-2 AAUI Notes
FriendlyNet can support a maximum of 40 nodes per network segment. This is more than the maximum of 30 nodes described in the 10BASE2

specification. This is achieved through use of more stringent design specifications for both the MAU and the Apple Coaxial cables, and by using a fixed, short cable connecting host to drop box. (This doesn't preclude the use of standard RG-58 C/U cables, but reduces the recommended node count to 30.)

General AAUI Interface Notes

Except for the pins that supply power, each AAUI signal has the same description, function, and electrical requirements as the AUI signal of the same name. This is detailed in IEEE Standard 802.3-1988 CSMA/CD, paragraph 7.6.3, P. 105.

To allow connection of Apple AAUI-equipped hosts to standard 802.3 MAUs, possibly accessing different media, an AAUI to AUI converter shall be provided. Because all Apple equipment isn't capable of supplying the +12 VDC @ 500 mA necessary to power a standard AUI as specified in the IEEE 802.3 standard, the converter requires external power.

A/UX 3.0: Requires MultiFinder to Run Macintosh Applications

Is it possible (and supported) to run individual Macintosh Toolbox off-the-shelf applications under A/UX 3.0 WITHOUT launching 7.0 MultiFinder? In other words, will A/UX 3.0 support A/UX 1.1 functionality, allowing me to launch individual applications from the command line, and return to the command line after I quit each application?

This article has been archived and is no longer updated by Apple.
A/UX 3.0 doesn't allow Macintosh applications to run without MultiFinder.
System 7 relies on the existence of MultiFinder.

Published Date: Feb 18, 2012

A/UX 3.0: Booting to a Known Good Kernel

Using A/UX 3.0, when I run newconfig or autoconfig, the kernel becomes unusable, and I have to reinstall. On other UNIX platforms, it's relatively painless to boot to a known good kernel, and then reconfigure the kernel. Is this possible on the Macintosh?

This article has been archived and is no longer updated by Apple.
The 3.0 newconfig is essentially the same as 2.0. The way to boot to a known good kernel is to "launch /newunix" from A/UX Startup. Then try /etc/newconfig.

Published Date: Feb 18, 2012

A/UX 3.0: Mac Apps Don‘t Need Recompile; A/UX Hybrids Do (9/94)

Has anything changed between A/UX 2.0.1 and A/UX 3.0 that would require users or developers to recompile their UNIX applications to get them to run?

This article has been archived and is no longer updated by Apple.
You don't need to recompile Macintosh applications.

You do need to recompile A/UX Hybrids.

Straight UNIX applications SHOULDN'T need recompiling if they're using shared libraries. The only changes to the kernel are for NFS.

A/UX 3.0: ISO 9660 CDs

Will ISO 9660 CDs with UNIX file systems operate under A/UX 3.0?

This article has been archived and is no longer updated by Apple.
ISO 9660 CDs aren't directly accessible through the UNIX file system under A/UX 3.0. They're mountable through the Finder as under the Macintosh OS, but they aren't accessible from the UNIX command line.

PowerBook Fax Sender 1.1.2 or Later: Fixes Page Length

When I send a fax from my PowerBook, the pages print out at the receiving fax machine with an extra 1/2 inch of white space at the top and bottom. The pages tear off in a non-standard size.

This article has been archived and is no longer updated by Apple.

The issue you refer to is a known issue with early Fax Sender versions. You should upgrade to Fax Sender 1.1.2 or later to correct this. Fax Sender 1.1.2 is installed from the Express Modem 1.0.4 disk and is backward compatible with the PowerBook Fax/Data Modem.

PowerBook: Fax Monitor Status Prevents Sleep

When Fax Monitor Status is the foreground application, the PowerBook won't go to sleep, even if the status is idle.
This article has been archived and is no longer updated by Apple.
This has been corrected so that the PowerBook will enter sleep mode if the Fax Monitor status is Idle. If, however, it is waiting for a call, the PowerBook will not go into sleep mode.

Macintosh Pascal: Memory Use by Programs

This article has been archived and is no longer updated by Apple.
About 35K of memory is available not only for your program text, but for program variables, the program's pseudo-code representation, debugging information and libraries. The majority of your Macintosh memory is used to keep as much of Macintosh Pascal resident in RAM as possible in order to minimize disk I/O. On a 512K Macintosh or Lisa, only 64K is available, due to pointer size limitations.

Version 2.0 of Macintosh Pascal lets you write larger programs, depending on the contents of the program, of approximately 750 lines on a 128K Macintosh and 2,000 on a 512K Macintosh.

Inside Macintosh provides a brief introduction to memory management in the Macintosh in the chapter "Macintosh Memory Management: An Introduction". Macintosh Pascal uses the Macintosh memory in a slightly different way.

The 2.0 version of Macintosh Pascal includes new predefined procedures for manipulating relocatable objects. (A relocatable object is an object that can be moved within memory and is referred to indirectly by means of a handle.) Anyone using these procedures needs to have a basic understanding of how Macintosh Pascal uses memory.

Macintosh Pascal uses two main run-time data structures: the machine stack and the general stack. The machine stack grows downward from high memory. From the bottom of the application heap just above the master pointer area, the general stack grows upward. The second stack is actually a pointer object that has a base fixed throughout a Macintosh Pascal session. When either the interpreter or the user interface is running, its code segments are moved to the top of the application heap and locked. Thus, programmers who cause objects to be allocated in the heap must be very careful not to cause the objects to be locked down just above the general stack. This will almost always cause the interpreter to run out of memory and exit to the Finder. Similarly, objects should not be allowed to be locked down just below the code segments that are locked high.

DAL 1.3.5: AsyncCTB (X.25) Only for VAX or A/UX DAL Servers

A DAL 1.3.5 document indicated that X.25 support is available for DAL to VTAM and TSO servers. Is this true?
This article has been archived and is no longer updated by Apple.
The AsyncCTB (X.25) network adapter will only go to VAX or A/UX DAL servers.

The only "async-type" input that IBM mainframe servers accept is dial-in to a Protocol Converter that supports VT100 terminal-type access.
